# 1. SECURITY TARGET INTRODUCTION

#### 1.1 FOREWORD

For convenience and ease of reuse of previous evaluation results (ANSSI-CC-2012/71), this security target is redacted as if the TOE was a composite TOE between the Cryptosmart applet and the underlying javacard platform. However this platform has not been evaluated on its own. In order to fulfill every assurance requirements complementary elements will be provided either as specific section in this ST or dedicated documents.

#### 1.2 SECURITY TARGET AND TOE IDENTIFICATION

This document constitutes the Security Target (ST) of the Cryptosmart card, version 5.1 developed by Ercom.

• ST name: Cryptosmart card 5.1 – Security target

• ST version: 5.1.2

ST Date: November 7, 2016

TOE identifier: Cryptosmart applet 5.1 on Oberthur ID-ONE COSMO V7.0.1-R2

• TOE version: 5.1

TOE Developer : ERCOM& Oberthur Technologies

Evaluation sponsor : ERCOM

This security target addresses a composite TOE evaluation in the sense of [CPESC] where:

- The certified platform IC is an NXP Secure Smart Card Controllers P5Cx081
- The Java Card platform is the ID-ONE COSMO V7.0.1 R2OS;
- The application is the Cryptosmart applet V5.1.

The platform is identified as follows:

Platform name	ID-One Cosmo V7.0.1-n R2.0 (Standard and Standard Dual)
Platform software identification	Javacard platform mask = "7101"
Platform IC reference version	P5CC081, P5CD081
Reference of the CC certificates of the underlying IC	BSI-DSZ-CC-0857-V2-2015

#### 1.3 CONFORMANCE CLAIMS

This Security Target claims conformance to CC version 3.1 with the following documents:

- "Common Criteria for information Technology Security Evaluation, Part 1: Introduction and general model", September 2012, Version 3.1 Revision 4 (CCMB-2012-09-001)
- "Common Criteria for information Technology Security Evaluation, Part 2: Security Functional requirements", September 2012, Version 3.1 Revision 4 (CCMB-2012-09-002)
- "Common Criteria for information Technology Security Evaluation, Part 3: Security Assurance requirements", September 2012, Version 3.1 Revision 4 (CCMB-2012-09-003)

Conformance is claimed as follows:

- Part 2: extended with the FPT\_EMSEC. All the other Security requirements have been drawn from the catalogue of requirements in Part 2
- Part 3: conformant. The chosen Evaluation Assurance Level is EAL4 augmented with ALC\_DVS.2 and AVA\_VAN.5

#### 1.5 TERMINOLOGY

Card admin Device for managing a fleet of Cryptosmart cards. station

Administrator Person authorized to access the administration station and manage the fleet of Cryptosmart

cards.

The administrator is the user of the applet before it is delivered to the final user.

**Authentication** Service ensuring the identity of a card.

Certificate Identity data and public key of a user signed by the private key of the certification authority.

**Card** This is the process where an administrator injects or generates the cryptographic keys inside the Cryptosmart card. The name certification comes from the fact a user certificate shall be imported inside the smartcard during this process.

**Clone card** Device having the capacity to substitute for a legitimate card, in particular to authenticate itself and generate a valid session key.

**CRL** Certificate Revocation List. List of certificates that are no longer authorized.

Cryptosmart Smartcard incorporating the Cryptosmart applet card

**Host** Represents the module managing communications with the smartcard. By extension it may be viewed as the device embedding the Cryptosmart card.

**Local attacker** Third party person trying to corrupt or recover sensitive data by accessing a Cryptosmart card directly without knowing the security code. This may be a legitimate user of a card of the same family as the TOE. The legitimate user of the TOE and the administrator are excluded from this definition.

Some data shall not be modified or recovered even knowing the TOE security code. In this case even the legitimate user may be considered as an attacker against these data.

**MAC** Message Authentication Code, a message sealing and integrity verification mechanism with secret key.

Masquerade Action aimed at deceiving a correspondent about his real identity.

Online attacker

Third party person trying to corrupt or recover sensitive data by intercepting and/or modifying the flows between equipment using Cryptosmart cards. The online attacker may possess lost or stolen cards of the same family as the TOE and knowing their Security Code. It may also be a legitimate user of another card of the same family as the TOE. The legitimate TOE user, the legitimate user of the card with which the TOE has to establish a session and the PKI administrator are excluded from this definition.

**Reset** Re-initialization of the smartcard volatile memory.

**Session key** 256-bit key generated by the Cryptosmart card at each Cryptosmart authentication protocol run. This key is provided to the host under a wrapped form. It is derived by the Cryptosmart card into keys transmitted to the host. These keys protect the flows exchanged between hosts.

User Person carrying a user type Cryptosmart card and knowing his security code

As a dishonest PKI administrator may issue any certificates he may impersonate any other user.

# 2. TOE DESCRIPTION

#### 2.1 TOE OVERVIEW

The TOE consists of a Javacard applet developed by Ercom running on a smartcard running the Oberthur **ID-ONE COSMO V7.0.1-R2**Javacard OS on NXP chip.

The TOE has three main usages:

- Provide the ability to authenticate a distant Cryptosmart card and negotiate a shared key with it;
- Act as a cryptographic processor, by providing cryptographic function which are:
  - User authentication by using a security code
  - Secure key storage, either for 256 bits symmetric keys or 2048 bits RSA keys
  - Key export to host interface, either for 256 bits symmetric keys or 2048 bits RSA keys
  - A subset of PKCS#11 functionalities. The smartcard offers in device cryptography. This allows performing cryptographic computation without exposing the secret key. Operations supported by the TOE are:
    - Symmetric encryption and decryption using AES-256.
    - Symmetric MAC generation and verification using HMAC-SHA256<sup>2</sup>
    - RSA-2048 decryption using PKCS#1.5 and PKCS#1.5-OAEP padding schemes
    - RSA-2048 signature using PKCS#1.5 padding scheme with no hash function (which allows the usage of any hash function: digest shall be performed by the host)
  - 2048 bits RSA key generation
  - o 256 bits symmetric key generation
  - Management of the extractable property for RSA and symmetric keys
  - Management of the key usage property for symmetric keys
  - o "Local encryption key" obtention by deriving internal keys
  - Random Number generation
- Provide a secure storage area.

The PKCS#11 C interfaces to smartcard functionalities is provided by the card driver which translates PKCS#11 C functions calls into smartcard commands. This driver is out of the scope of the evaluation and is not required to use the TOE.

The smartcard PKCS#11 functionalities are called by extension PKCS#11 functions in this document.

#### 2.2 TOE SAMPLE USAGE: THE CRYPTOSMART SYSTEM

This section presents a Cryptosmart card usage example.

Ercom has developed a product family called Cryptosmart for mobile and nomadism security. It protects any kind of devices (mobile, laptops, fixed phones, vehicles) on any kind of networks (mobile, wireless, wireline, satellite) for any kind of applications (mail, voice, SMS, video, business applications). In all cases, it always uses a Cryptosmart card.

The Cryptosmart system consists in:

<sup>2</sup>This functionality is outside evaluated scope

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2	о ургозна он он	Cryptosmart applet 5.1 - Pul	olic Security-
<b>E</b> com	Public Security Target		9/92

- A Cryptosmart Gateway which interconnects external devices with the enterprise/customer IT center for data communications via a VPN and for encrypted-clear calls; it also provides routing and SIP functionalities for secure end-to-end VOIP calls between two devices.
- Cryptosmart PC Suite and Cryptosmart Mobile Suite: it provides protection of the devices, protection
  of the data flows, and protection of voice calls
- Cryptosmart Card (the TOE) providing strong authentication and key management functions for both the Cryptosmart Gateway and the devices;
- Cryptosmart CardAdminStation for administration and management of Cryptosmart Cards.

The Cryptosmart Card acts as a root of trust for the Cryptosmart system by

- protecting essential secrets which allow user authentication,
- managing cryptographic keys which allow the protection of user's sensitive data and communications.

For example, thanks to the use of the Cryptosmart Card (TOE), Cryptosmart Mobile Suite provides the following security features for PDA/Smart phones:

- Strong authentication
- Voice encryption
- SMS protection
- VPN
- Local device encryption
- Network firewall

The secure communications provided by the Cryptosmart solution protect the user's sensitive data in confidentiality, integrity and authenticity.

The following diagram presents an example of architecture with Cryptosmart Mobile Suite, Cryptosmart PC Suite, Cryptosmart Gateway, and Cryptosmart CardAdminStation. Thus, users can:

- Get access to their professional mail securely
- · Get access to their intranet securely
- Get access to the internet via a proxy and thus benefit from the already established policy of their organization in terms of internet access
- Make secure end-to-end calls
- Call any anyone in their organization while securing the outside path of the communication thanks to the PBX interconnection
- Send secure SMS

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2		Cryptosmart applet 5.1 - Publi	c Security-
<b>E</b> com	Public Security Target		10/92

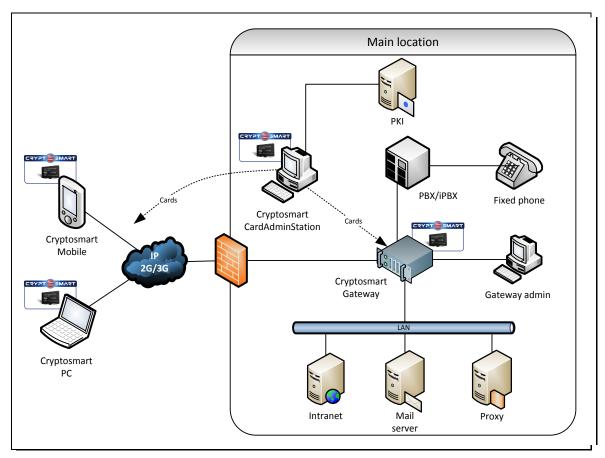

Figure 1: Cryptosmart sample architecture

Mobile devices are by definition easily lost or theft. Usage of the TOE in this system allows a secure storage of user secrets which are never directly stored on the mobile device.

- User data remain protected in case of theft by an attacker as protection keys are stored by the smartcard and using the Cryptosmart card requires a security code;
- The most sensitive cryptographic keys never appear on the host device: cryptographic operation involving them are performed in card;
- The device does not become a threat for the customer system as data required for authentication remain in the smartcard, not accessible to the attacker. The attacker may not enter the customer system by authenticating as the user he compromised.

Usage of the TOE in the Gateway for authentication purposes provides the following advantages in case of Gateway compromise:

- The attacker may not authenticate as a valid Gateway as authentication private keys are stored by the card and are not extractable;
- The Cryptosmart authentication protocol involves symmetric secrets as a second security layer over the asymmetric one. Smartcard usage allows protecting these secrets. Otherwise they would have been stored readable on the Gateway.

#### 2.3 TOE DESCRIPTION

#### 2.3.1 USAGE OF THE TOE

The Cryptosmart card is delivered to customers in a state in which no key is installed. An administrator is in charge of personalizing it for each user. Card personalization is done by using a software tool called card admin station provided by Ercom which exists in two versions:

- A command line version allowing automation of the personalization process;
- A graphical version allowing card by card personalization.

The personalization process consists in providing to the smartcard its cryptographic keys and certificates. Cryptographic keys may either be

- Generated inside the smartcard allowing an extremely secure configuration as these keys may never be extracted outside the smartcard;
- Imported inside the smartcard.

This latter case reaches the same security as the first if the customer's information system stores imported keys in a secure way. It allows a more flexible management of the cards: a card containing the same keys can be generated. It allows card replacement without interrupting the services offered by the smartcard.

Card personalization requires usage of an external PKI to generate the user certificate on which distant user authentication relies. As other keys, the corresponding private key may be either generated internally to the smartcard or externally by customer's PKI.

During card personalization, the administrator also:

- Sets a minimal security code length and a default code. The TOE user can change this code. This
  minimal security length for security codes must be comprised between 4 and 8, or be 0 to avoid usage
  of a user security code. This must be set at card creation, and a user won't be able to reduce the initial
  code length.
- Asks for PUK code creation: the TOE generates 15 PUK codes and exports them. PUK codes may never be exported afterward. PUK codes have a length of 8 digits.
- Generates and injects a recycle code.
- Inject cryptographic keys inside the smartcard which are:
  - The family key which is a key shared by every card of a family. (note: an administrator may administrate several families);
  - o The wrapping key. The wrapping key may also be generated internally to the smartcard.
  - The local encryption master keys.
  - o The APDU encryption initialization key
  - The user authentication key and corresponding certificate (used in Cryptosmart authentication protocol)
- Sets the card type (user card or gateway card)

PUK codes are used for unlocking the smartcard in case the user blocks his card by entering wrong security codes.

The family key is derived into an identity protection key used during Cryptosmart authentication protocol run.

The wrapping key is a key divided into an encryption key and an integrity key. These key are used to export keys negotiated by the Cryptosmart authentication protocol to the host while protected from disclosure and modification.

The local encryption key is a key which may never be extracted from the TOE but may be derived into several keys. Those derived keys are exported to the host.

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2	0.7p.00	Cryptosmart applet 5.1 - Pul	blic Security-
<b>E</b> com	Public Security Target		<b>12/</b> 92

The card type defines user cards and gateway card. Gateway cards have the same functionalities as user cards but are optimized to be used on a server. This is useful in the case if the TOE is used in standalone appliances where cryptographic operation shall be performed without user interaction.

A specific command ends the personalization process: from now the card only allows key generation or import for PKCS#11 functions. The keys injected by the administrator (APDU encryption initialization key and user authentication key) can neither be changed by the user nor be reached directly by the user (he may only use them). The card is in a state where it can be delivered to the user.

When a user receives its smartcard he should change the default security code set by the administrator. He may use any functionality of the smartcard described hereafter.

The user may block his smartcard by entering a wrong security code several times (only 2 successive failures are authorized. The third failure blocks the card).

The card can be unblocked by entering a PUK code (which has been generated during the personalization process). The card status contains the current PUK code number to use. To unblock the card the user shall enter this precise PUK code (entering another PUK code even generated by the TOE during personalization will not unblock the card and count as failure). After 10 unsuccessful PUK code entries the whole content of the card but the recycle code is wiped. The card may only be recycled. Once entered successfully a PUK code unblock the card and cannot be used again (the current PUK code number is increased).

If the user blocks the card and no PUK code are available the card content is wiped.

The user unlocks the card by entering his security code. He may explicitly lock the smartcard by logging off.

Once the smartcard unlocked the user may use any functionality described § 2.1.

As the user certificate has a limited validity date, the smartcard has the same validity date. At this date the user shall receive a new smartcard. Continuity of cryptographic services which do not involve this certificate is ensured by personalizing both cards with the same keyset. The old card shall then be recycled by using the recycle code. Card recycling erases any data contained in the card and returns it in the same state as it was at the time of delivery to customer. This card may be re- personalized for another user.

#### 2.3.2 **TOE FUNCTIONALITIES**

This part describes the services that the TOE offers to its users. These services are:

- User authentication;
- Cryptosmart authentication protocol run;
- Cryptosmart "stateless" authentication protocol run;
- Signature generation (both symmetric and asymmetric);
- Encryption (AES) and decryption (AES and RSA);
- External key storage;
- Key generation;
- Local protection key obtention
- User data storage
- Key or user data export.

The TOE offers also an interface for the host to get TOE status which contains the current card state, the serial number, current security code entry failures and other information about the TOE.

**Note:** the symmetric signature generation services are not included in the TOE.

#### **USER AUTHENTICATION**

Each TOE user possesses a 4 to 8 digits security code. The TOE authenticates its user by confronting the security code given by the user to the value it stores. A successful authentication unlocks the card functionalities and allows the user to perform cryptographic operations.

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2		Cryptosmart applet 5.1 - Pub	lic Security-
<b>E</b> com	Public Security Target		13/92

After 3 security code entry failures the TOE is locked in a "BLOCKED" state and may only be unblocked by a correct PUK code entry or erased and reset by a correct recycle code entry.

PUK codes also allow authenticating the user. Anyway PUK code entry is forbidden in any state other than BLOCKED.

#### SECURITY CODE CHANGE

The TOE allows the user to change its security code. This can only be done if the user has previously authenticated himself to the TOE.

Security code choice is free to the user with the only limitation that its length shall be comprised between the lower bound set by the administrator and 8.

#### KEY NEGOTIATION (CRYPTOSMART AUTHENTICATION)

To establish a secure channel between two devices hosting a Cryptosmart card, the smartcard performs:

- The mutual authentication of both components.
- The negotiation of a session key which will be derived into cryptographic parameters and keys.

The authentication of the distant user is based on standard X.509 certificates.

This key negotiation is based on a DH based security proven authentication protocol.

The Cryptosmart card provides two implementations of the authentication protocol: One is statefull for being used in a connected mode, the other one is stateless for being used in an asynchronous mode.

Keys negotiated during the authentication protocol are exported under a wrapped form: protected both in confidentiality and integrity. They must be derived to get keys shared between both devices.

The Cryptosmart card wrapping method in version 5.1 is different from the 5.0 version. A compatibility mode is provided. This mode shall be deactivated for being in the evaluated configuration.

#### **KEY PROTECTION**

The TOE offers keys storage capabilities for external application (Cryptosmart suite, S/MIME application, third party local encryption software, etc.) and for PKCS#11 purposes. A user may generate cryptographic key through the Cryptosmart card. He can store cryptographic keys inside the smartcard. The TOE protects these keys by conditioning their access to the user authentication.

Keys stored may be either RSA keys with a 2048 bits length or 256 bits symmetric keys. Both types of keys may be extractable or not. A user can never have access to the value of non extractable keys. He can only use them to perform cryptographic operation.

Symmetric keys have a key usage attribute which defines if the key may be used for encryption, signature or both usages.

#### **KEY DERIVATION**

Key derivation is performed inside the smartcard. This allows the master session key (negotiated during the authentication protocol) to remain unexposed even to the legitimate user. The derivation process also derives a fresh key from the input, returned under a wrapped form.

#### **RSA** SIGNATURE

The TOE allows the user to sign buffers using RSA with a PKCS#1.5 padding scheme. The signature private key is one of the RSA keys stored internally.

**Note**: the TOE only performs operation with private key. Public key operation (RSA signature verification) is performed by the host.

#### **RSA DECRYPTION**

The TOE allows the user to decrypt buffers using RSA with a PKCS#1.5 or OAEP padding scheme. The signature private key is one of the RSA keys stored internally.

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2		Cryptosmart applet 5.1 - Pub	lic Security-
<b>E</b> com	Public Security Target		<b>14/</b> 92

**Note**: the TOE only performs operation with private key. Public key operation (RSA encryption) is performed by the host.

#### HMAC-SHA256 SIGNATURE/ VERIFICATION

The TOE allows the user to sign buffers or verify buffer signature using SHA256 in HMAC mode. The signature key is one of the symmetric keys stored internally.

This feature is excluded from the evaluated configuration.

#### **AES ENCRYPTION / DECRYPTION**

The TOE allows buffer encryption or decryption using AES in ECB or CBC mode. The key is one of the symmetric keys stored internally.

By default symmetric keys have a "disable security check" attribute set to false: each symmetric key is limited to perform 150 block operation (encryption and decryption). This check can be disabled at key creation.

**Remark**: RSA, AES and HMAC operation offer PKCS#11 functionalities. The related key management is provided by the TOE. A user can generate, import cryptographic keys, set their extractable attribute. An administrator can also generate or import cryptographic keys and set their extractable attributes during the certification process. In this case the user will be able to manage these keys just as if they were imported by him.

#### LOCAL PROTECTION KEYS OBTENTION

The TOE has 2 "local protection master keys", which are not extractable. The TOE allows deriving these keys for the user to obtain 256 bits keys which may be used for local protection.

#### **RANDOM NUMBER GENERATION**

The TOE allows random number generation using the card processor true random generator which is post-processed by a cryptographic deterministic random number generator.

#### **WIPE ORDER**

The TOE allows the user to send it a wipe command. This command erases every secret contained inside the TOE: the TOE has the same content as when it was delivered to the customer. The only commands allowed in this state are to get the card status and to recycle the card, to be able to reuse it.

# 2.3.3 **TOE ADDITIONAL FEATURES**

This part describes some features of the TOE independent from user actions.

#### **APDU ENCRYPTION**

Because an attacker has the possibility to listen to the communication channel between the TOE and the host, the TOE implements an encryption mechanism which protects this channel. All sensitive command and associated answer is sent encrypted. Security code entries, PUK unlock commands, and every other command sent when the user has authenticated to the TOE is sent protected in confidentiality.

The encryption mechanism provides the following protection to communication between the TOE and the host:

- Protection in confidentiality through AES encryption;
- Protection in integrity through symmetric signature (retail AES-CBC mac, also called EMAC): any command modified by an attacker is detected and rejected;
- Protection against replay: an attacker can't replay an encrypted command he previously intercepted.

# POWER CONSUMPTION MANAGEMENT

The TOE implements functions to efficiently manage power consumption. The TOE is a smartcard which must be powered on to perform its operations. If unpowered, the user shall re-authenticate to be able to use it.

The TOE implements an ephemeral security code mechanism to manage these re-authentications. Once the user is authenticated, the TOE generates an ephemeral security code at random and sends it to the host. This ephemeral security code is managed by the TOE driver on the host.

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2		Cryptosmart applet 5.1 - Public Security-	
<b>E</b> com	Public Security Target		<b>15/</b> 92

The TOE driver uses it to automatically re-authenticate the user after a TOE power off. The user has no action to perform by himself: the loss of power becomes transparent. When the host device is locked by the user, the driver erases the ephemeral security code from its memory forbidding its compromise by an attacker.

If authentication using this ephemeral code fails, the TOE erases the ephemeral code it stores and returns with error.

#### "LIGHT" UNLOCK

When the host device has been locked, some software shall be able to perform cryptographic operations in background. To handle this case the TOE has a special state called RESUMED\_USER. In this state the user has a limited access to the TOE. Some PKCS #11 operations are forbidden: each key has a user defined "useable in resumed" attribute. If this attribute is set to false, any command using the corresponding key is forbidden (as if the TOE was locked).

The TOE may reach the RESUMED\_USER after a power loss by sending a dedicated correctly encrypted command. The fact that this command is correctly encrypted implicitly authenticates the user as:

- The symmetric signature of the APDU encryption mechanism proves that the driver possesses the correct encryption key
- The driver may possess the correct encryption key if and only if the user already successfully authenticated to the TOE.

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2	oryptosinart data 5.1	Cryptosmart applet 5.1 - Pub	olic Security-
<b>E</b> com	Public Security Target		16/92

#### 2.3.4 **TOE** LIFE CYCLE

This part describes the different states of the TOE, with the corresponding possible transitions.

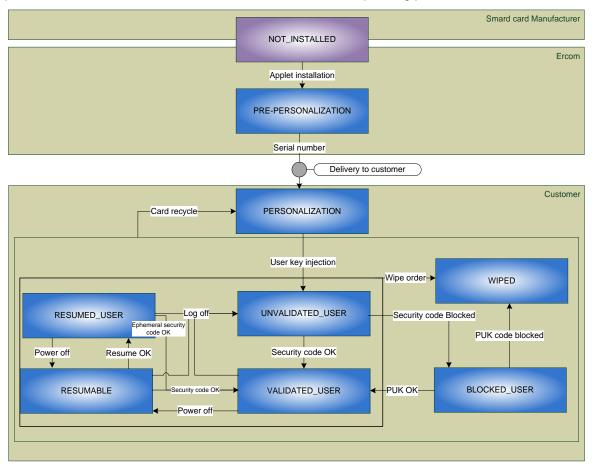

Figure 2: Cryptosmart card life cycle

Cryptosmart cards consist of a Cryptosmart Java applet installed on a Javacard platform compatible with Javacard 2.2.2 and Global Platform 2.2.

Cryptosmart cards can be in one of the states described in Figure 1.

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2	o.,,p.co	Cryptosmart applet 5.1 - Pu	blic Security-
<b>E</b> com	Public Security Target		17/92

Life Cycle State	Comment
NOT_INSTALLED	Card delivered by the card manufacturer to ERCOM. This state is never seen by the end customer.
PRE-PERSONALIZATION	Card with Cryptosmart applet loaded.
PERSONALIZATION	Card with Cryptosmart applet and serial number loaded. This is the way the card is initially provided to the customer.
UNVALIDATED_USER	Card state when the card contains its keys. The card is not Security Code unlocked.
VALIDATED_USER	Card unlocked with validated Security Code or ephemeral security code.
RESUMABLE	Card after a card reset from a validated user state
RESUMED_USER	Card after a successful resume command from RESUMABLE state
BLOCKED_USER	Card blocked after repeated Security Code errors.
WIPED	Card with every keys erased

Table 1 : Cryptosmart card life states

#### NOT\_INSTALLED AND PRE-PERSONALIZATION

These states are the smartcard states through which the TOE passes before being delivered to the user.

During these states Ercom:

- Inserts the applet inside the card;
- Inserts the card serial number;
- · Configures card functionalities;
- Inserts delivery information;
- Deactivates the javacard Card Manager to forbid any subsequent applet loading or erasing.

At the end of this phase the TOE is delivered to the customer.

# **PERSONALIZATION**

The Cryptosmart card is in this state when delivered to the customer. This state allows card personalization i.e.:

- User key pair generation or import
- User symmetric key generation or import
- User certificate import
- PUK codes generation
- Family key insertion
- Recycle code insertion
- Security code and its properties insertion

Only a subset of the functions of the TOE is accessible in this state.

Personalization operations can be performed using the card-admin station which also allows management of the cards.

Once every user keys have been inserted, the card may get into the UNVALIDATED\_USER state. This state transition is explicitly ordered by a call to the function "create card".

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2		Cryptosmart applet 5.1 - Pul	blic Security-
<b>E</b> com	Public Security Target		<b>18/</b> 92

#### UNVALIDATED\_USER

The smartcard is in this state when no security code has been successfully entered inside one session. This state allows access only to the functions:

- Get card information;
- Initialize the APDU encryption;
- User authentication;
- Wipe the card;
- Card recycle.

Once the security code has been successfully entered, the card shall get into the VALIDATED\_USER state.

If the maximum security code entry attempt has been reached, the card shall get into the BLOCKED\_USER state.

After a successful recycle code entry, the card shall get into a PERSONALIZATION state.

A wipe order turns the card into a WIPED state.

#### VALIDATED USER

In this state, every user function is accessible.

The VALIDATED\_USER state corresponds to the operational state: a fully personalized card, with the user security code successfully entered.

After a successful recycle code entry, the card shall get into a PERSONALIZATION state.

After a log off, the card gets into an UNVALIDATED\_USER state.

After a card reset (power off), the card gets into a RESUMABLE state if allowed by configuration.

After a successful recycle code entry, the card shall get into a PERSONALIZATION state.

A wipe order turns the card into a WIPED state.

#### **RESUMABLE**

This state allows every one of the following actions and no other:

- Get card information
- Enter the security code
- Wipe the card;
- Resume command
- Log off

Once the security code has been successfully entered, the card shall get into the VALIDATED USER state.

If the resume command is successful and contains the ephemeral security code, the card shall get into the VALIDATED USER state.

After too many unsuccessful security code entries, the card shall get into a BLOCKED\_USER state.

If the resume command is successful without the ephemeral security code, the card shall get into the RESUMED USER state.

If the resume command is unsuccessful, the card shall get into the UNVALIDATED\_USER state.

After a log off command, the card must get into the UNVALIDATED\_USER state.

After a successful recycle code entry, the card shall get into a PERSONALIZATION state.

A wipe order turns the card into a WIPED state.

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2	oryprosman oura orr	Cryptosmart applet 5.1 - Pu	blic Security-
<b>E</b> com	Public Security Target		<b>19/</b> 92

#### RESUMED\_USER

The smartcard is in this state when a successful resume without ephemeral security command has been sent to the card from the RESUMABLE state.

This state allows only a restricted usage of the TOE:

- The authentication protocol and the derivation function are accessible
- Usage of the Cryptosmart card as a cryptographic token is allowed, but the usage of some keys in this state may be forbidden by the user

Once the security code has been successfully entered, the card shall get into the VALIDATED\_USER state.

After too many unsuccessful security code entries, the card shall get into a BLOCKED\_USER state.

After a log off command the card must get into the UNVALIDATED\_USER state.

After a card reset, the card shall get into a RESUMABLE state.

After a successful recycle code entry, the card shall get into a PERSONALIZATION state.

A wipe order turns the card into a WIPED state.

#### **BLOCKED\_USER**

The card is in this state once the maximum security code entry has been reached. The card shall refuse any command except a PUK code entry or commands to get the card status.

This state allows every one of the following actions, and no other:

- · Get card information
- Enter PUK code

After a successful PUK code entry, the card shall get into a VALIDATED\_USER state.

After 10 successive wrong PUK code entries, the card shall get into a WIPED state.

If no PUK code is available the card shall immediately get into a WIPED state.

After a successful recycle code entry, the card shall get into a PERSONALIZATION state.

A wipe order turns the card into a WIPED state.

#### **WIPED**

The card is in this state once the PUK code entry maximum attempts number has been reached; or the card has received a "wipe" order.

The card shall refuse any command except a recycle or a get card status command.

In this state every customer secret has been erased except the recycle key.

After a successful recycle code entry, the card shall get into a PERSONALIZATION state.

#### 2.3.5 **TOE USER**

The TOE possesses two users. They are identified implicitly depending on TOE state

The card administrator is the TOE user while it is in PERSONALIZATION or WIPED states. He performs card personalization actions. In WIPED state the card administrator may recycle the card (using the recycle key). As in these states the commands require no authentication the administrator shall operate the card in a secure environment.

The second user is the "local user". He is the TOE user while it is in UNVALIDATED\_USER, VALIDATED\_USER, RESUMABLE, RESUMED\_USER, or BLOCKED states.

#### 2.3.6 USER CARDS AND GATEWAY CARDS

The Cryptosmart card can be personalized into two card types: user cards and gateway cards.

Ed : 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2		Cryptosmart applet 5.1 - Pul	blic Security-
<b>E</b> com	Public Security Target		<b>20/</b> 92

Gateway cards are Cryptosmart card intended to be used in a server and may be used heavily. For these reasons, gateway cards differ from user cards by the possibility to reuse the private Diffie-Hellman parameter for Cryptosmartmutual authentication protocol run.

Otherwise the card would only offer a limited number of authentications as only a limited write number in EEPROM are allowed. The host has to reset this parameter for the card to use a new one.

In the scope of this evaluation we assert that the host sends a commandto renew the private DH parameter after each authentication protocol run.

The administrator has also the possibility to set a 0 length security code for Gateway cards. In the scope of this evaluation we assert this is not the case.

#### 2.4 INTEGRATION IN JCS LIFE CYCLE

[JCS-PP] describes the life cycle of a javacard system (JCS) as follows:

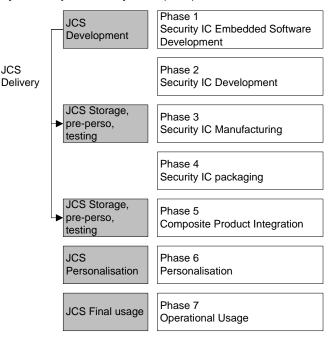

Figure 3: JCS life cycle

Phase 1 to phase 5 are performed as described in [IOC7 - ST].

Personalization in phase 6 is decomposed into two parts:

- One is performed by Oberthur concerning the personalization of the javacard platform. At the end of this part the card is delivered to Ercom and is inTOE's NOT\_INSTALLED state
- One is performed by Ercom by installing the Cryptosmart applet and performing pre-personalization operations. This corresponds to PRE-PERSONALIZATION state of the TOE

The delivery point is at the end of phase 6.

Phase 7 corresponds to other subsequent states (PERSONALIZATION, UNVALIDATED\_USER, VALIDATED\_USER, RESUMABLE, RESUMED\_USER, BLOCKED\_USER and WIPED) of the TOE.

#### 2.5 COMPOSITE TOE SCOPE

The TOE to be evaluated is composed of TOE part 1 and TOE part 2.

TOE part 1 identifies the platform ID-ONE COSMO V7.0.1 R2 javacard OS on the certified IC. This TOE part includes software (the firmware, the Card Manager and the operating system) embedded on a microcontroller

According to [IC\_ST] compatible chips are:

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2	oryprosman our a cri	Cryptosmart applet 5.1 - Public Security-	
<b>E</b> com	Public Security Target		<b>21/</b> 92

- NXP P5CD081V1A,
- NXP P5CC081V1A.

[IC\_ST] also mentions NXP P5CD016/021/041/051 which are configuration options present in the IC evaluation, but which are not used for the javacard platform.

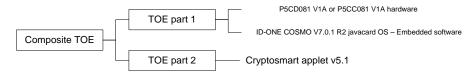

TOE part 1 is a javacard platform compliant with Java Card 2.2.2and Visa GlobalPlatform 2.2.

TOE part 2 identifies the Cryptosmart applet v5.1. This applet is a Java Card application which enables the previously described features.

The TOE communicates with a terminal device (for example a PC with a card reader) by APDU messages compliant with the ISO/IEC 7816-4 standard. This terminal device is identified as "the host" in this document.

APDU messages may only be transmitted using the contact interface in the evaluated configuration.

This means that the contactless interface on the platform must be deactivated.

The TOE scope is represented Figure 4. [IOC7-ST] gives full details on TOE part 1 scope.

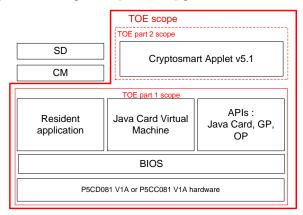

Figure 4: TOE scope

SD and CM are not part of the TOE as CM is deactivated before delivery to customers.

The TOE part 1 provides the following services used by TOE part 2:

- · Security code management and user authentication through the PIN object;
- Cryptography services including symmetric encryption and decryption, RSA encryption and decryption, RSA signature and verification and generation of random data;
- Physical protection of stored data ensuring their confidentiality and integrity.

The TOE part 2 provides the services which will be used by the Cryptosmart user. These services were previously described § 2.2.

#### 2.5.1 **TOE PART 2 SCOPE OF EVALUATION**

The scope of evaluation encompasses all the security features offered by TOE part 2 with the exception of the symmetric and RSA signature service.

The evaluated TOE also fixes TOE configuration choices and some constraints on TOE usage which are described in the TOE user guide ([CSMART\_USER\_GUIDE]).

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2		Cryptosmart applet 5.1 - Publ	lic Security-
<b>E</b> com	Public Security Target		<b>22/</b> 92

TOE configuration is performed by Ercom during the PRE-PERSONALIZATION state, where it initializes the internal random generator; inserts the product serial number and creates files which may be used by the customer. The evaluation scope includes any such configuration.

In terms of life cycle the evaluated configuration includes every state starting from PERSONALIZATION.

Ed : 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2		Cryptosmart applet 5.1 - Pul	blic Security-
<b>E</b> com	Public Security Target		23/92

# 3. SECURITY PROBLEM DEFINITION

#### 3.1 ASSETS TO PROTECT

This section lists the assets which are security relevant for the TOE. Assets for the TOE are divided into three categories:

- Primary assets which are user data from IT environment which shall be protected using the security functions offered by the TOE. This intended protection is addressed by organizational security policies;
- Secondary assets which are needed by the TOE to offer its security services. We divide secondary assets into:
  - User assets: these are data created by or for the user.
  - TSF assets: these are data created by the TOE or for the TOE internal usage...

#### 3.1.1 PRIMARY ASSETS

#### D.PLAINTEXT\_DATA

These are user data which need protection in confidentiality. TOE user uses the TOE to protect them in confidentiality.

#### D.USER\_STORED\_KEYS

These are the RSA or symmetric keys stored by the user inside the TOE. Each of the key is stored with their attributes. The asset includes both the key and attributes.

#### **D.USER STORED DATA**

The TOE allows the user to store raw data. This asset represents these data, such as the user certificate.

#### 3.1.2 USER ASSETS

#### **D.SESSION KEYS**

These are the keys negotiated during the Cryptosmart authentication protocol. These keys are derived into keys which will be used by external application (the Cryptosmart suite for instance). These keys are present in plaintext inside the TOE (when managed by the Cryptosmart applet) or in wrapped form when outside the TOE.

# D.USER\_SIGNATURE\_KEY

This is the RSA signature key used during the authentication protocol. This key is the private RSA key which public key is contained in the user certificate. It is not extractable.

## D.USER\_AUTH\_CODE

These are the codes allowing getting the TOE in a VALIDATED\_USER state. Authentication codes are:

- the security code of the user: it allows to login successfully to the TOE (a TOE state change from UNVALIDATED USER to VALIDATED USER):
- the PUK codes: it allows to unblock the TOE (a TOE state change from BLOCKED\_USER to VALIDATED\_USER)
- the ephemeral security code: it allows a TOE state change from RESUMABLE to VALIDATED\_USER
- the recycle code: it allows a TOE state change from any state to PERSONALIZATION

#### 3.1.3 **TSF DATA**

## D.TOE\_INTERNAL\_DATA

Internal data are the keys which impact only internal behavior of the TOE. Some of them are inserted in the PERSONALIZATION state. These keys are:

• The keys derived from the family key

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2	oryprosman oura cri	Cryptosmart applet 5.1 - Pul	blic Security-
<b>E</b> com	Public Security Target		<b>24/</b> 92

- The wrapping key (includes both encryption and MAC keys)
- The APDU initialization key which is an RSA encryption key used to initialize the APDU encryption mechanism. It allows the TOE to exchange APDU encryption keys (D.APDU KEYS) with the host

Some others are generated and stored inside the TOE. These are:

The RNG internal state.

#### **D.TOE INTERNAL INFORMATION**

Internal information is data used by the TOE with no need of confidentiality but which shall not be modified. This information is needed for a proper behavior of the TOE and are:

- The card state.
- The card flags giving information on already performed security initialization function.
- The commercial version number of the applet.
- The applet source code release identifier.
- The build version of the applet.
- The applet compilation date.
- The card serial number.
- The remaining number of times an incorrect Security Code that can be presented before the card is blocked.
- The number identifying the current PUK code.
- The number of times an incorrect PUK code can be presented before the card is blocked.

#### **D.APDU KEYS**

These are the APDU encryption and APDU integrity keys.

#### D.APP\_CODE

The code of the TOE, (TOE part 1 and TOE part 2)

#### 3.1.4 **SECURITY NEEDS**

Asset	Confidentiality	Integrity	Availability
D.PLAINTEXT_DATA	Yes	No	No
D.USER_STORED_KEYS	Yes	Yes	No
D.USER_STORED_DATA	Yes	Yes	No
D.SESSION_KEYS	Yes	Yes	No
D.USER_SIGNATURE_KEY	Yes	Yes	No
D.USER_AUTH_CODE	Yes	Yes	No
D.TOE_INTERNAL_DATA	Yes	Yes	No
D.TOE_INTERNAL_INFORMATION	No	Yes	No
D.APDU_KEYS	Yes	Yes	No
D.APP_CODE	No	Yes	No

**Table 2: Assets security needs** 

#### 3.2 ASSUMPTIONS

#### A.TRUSTED ADMIN

The smartcard administrator is not careless, willfully negligent or hostile and does not voluntarily disclose data he inserted in the TOE during configuration.

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2	oryptosmart card 3.1	Cryptosmart applet 5.1 - Pub	olic Security-
<b>E</b> com	Public Security Target		<b>25/</b> 92

#### A.TRAINED ADMIN

The smartcard administrator is correctly trained to the TOE usage.

#### **A.CONFIGURATION**

The TOE is correctly configured while in PERSONALIZATION state. Configuration is considered correct if:

- The signature private key matches the public key contained in the user certificate.
- The administrator has correctly set the required security code length.

#### A.KEY\_QUALITY

Keys generated outside the TOE are of appropriate quality. Appropriate quality may be reached by following the ANSSI rules for key generation from [KEY\_ANSSI].

# A.SECURE\_KEY\_MANAGEMENT

Some keys are generated outside the TOE and may be stored by the administrator (to recreate a card for the same user). An attacker may not have knowledge of these keys during their generation, transmission to the administrator or by accessing their backup.

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2		Cryptosmart applet 5.1 - Pul	olic Security-
<b>E</b> com	Public Security Target		<b>26/</b> 92

#### 3.3 THREATS

The following threats are adapted from the [PP CM] protection profile:

#### T.TOE DATA CORRUPTION

A local or distant attacker can modify the user keys, user data or TSF data stored or in use inside the TOE. This may for instance allow the attacker to replace user key by keys he knows or weaken targeted keys. A consequence of this threat is leading to attacks defeating OSP.SYMMETRIC ENCRYPTION

Impacted assets: every identified asset except D.PLAINTEXT\_DATA

## T.TOE DATA COMPROMISE

A local or distant attacker can obtain the user keys, user data or TSF data stored or in use inside the TOE. A consequence of this threat is leading to attacks defeating OSP.SYMMETRIC\_ENCRYPTION *Impacted assets:* every identified asset except D.PLAINTEXT\_DATA

#### T.ABUSE FUNC

An attacker with high attack potential may use TOE functions intended for installation or configuration of the TOE which shall not be used for operational cryptographic keys or user data in order

- to disclose or manipulate user data or keys, or
- to enable attacks against the integrity or confidentiality of user data or keys by:
  - manipulating (explore, bypass, deactivate or change) security features or functions of the TOE or
  - o disclosing or manipulating TSF Data.
- to enable attacks against the integrity of TOE part 2 code (D.APP\_CODE)

Impacted assets: every identified asset

#### T.PHYSICAL

The attacker discloses or modifies the design of the TOE, its sensitive data or application code by physical (opposed to logical) tampering means. This threat includes failure analysis, electrical probing, unexpected tearing, and DP analysis.

This threat is taken from [IOC7 - ST]: the IC must be designed in accordance with a well-defined set of policies and standards (likely specified in another protection profile), and will be tamper resistant to actually prevent an attacker from extracting or altering security data (like cryptographic keys) by using commonly employed techniques (physical probing and sophisticated analysis of the chip). This especially matters to the management (storage and operation) of cryptographic keys. It also refers to all the security aspects related to confidentiality and integrity of code and data. *Impacted assets:* every identified asset.

#### T.MASQUERADE

An attacker with high attack potential may masquerade as an authorized data source or receiver to perform operations that will be attributed to the authorized user or may gain undetected access to cryptographic module causing potential violations of integrity or confidentiality of the user data, the user keys or the TSF data.

For instance the attacker can have access or modify the user security code or PUK codes, in order to get illegitimate access to the TOE.

Impacted asset: D.USER\_AUTH\_CODE D.USER\_STORED\_KEYS D.USER\_STORED\_DATA D.PLAINTEXT DATA D.TOE INTERNAL DATA

This security target also considers the following threats:

#### T.KEY DERIVE

A local or distant attacker with high attack potential is able to compute private key from publicly available data (for instance compute an RSA private key from the corresponding public key, or perform a brute force attack on a symmetric key from known plaintext).

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2	oryptosinart data 5.1	Cryptosmart applet 5.1 - Publ	lic Security-
<b>E</b> com	Public Security Target		<b>27/</b> 92

Impacted assets: D.USER\_SIGNATURE\_KEY D.USER\_STORED\_KEYS

# T.INTERFACE\_EAVESDROP

A local attacker with high attack potential can act on the TOE interfaces in order to

- get knowledge of user data or user keys, or
- modify user data or user keys when transmitted to the TOE.

Impacted assets: D.USER\_AUTH\_CODE D.USER\_STORED\_KEYSD.PLAINTEXT\_DATA D.USER\_STORED\_DATA

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2	oryprosman sara ser	Cryptosmart applet 5.1 - Pul	blic Security-
<b>E</b> com	Public Security Target		28/92

#### 3.4 **OSP**

This part describes the organizational security policies the TOE shall conform to. We divide these OSP into 3 categories the directives and rules the TOE shall follow; the security policies that TOE usage allows to cover; and OSP which allow reaching the aimed security level.

#### 3.4.1 DIRECTIVES AND RULES

#### OSP.RGS\_CRYPTO

Cryptographic mechanisms conform to rules and recommendation from [CRYPTO\_ANSSI]. Keys are generated with mechanisms conformant to rules and recommendation from [KEY\_ANSSI].

#### 3.4.2 IT SECURITY POLICY

#### **OSP.MUTUAL AUTHENTICATION**

The TOE shall allow to authenticate remote users and to negotiate a shared secret key. The TOE shall forbid an attacker with high attack potential to cause the TOE to run successfully the Cryptosmart authentication protocol by forging or replaying authentication packets. (The attacker's goal is to be falsely authenticated by the TOE which could lead to the possibility of man in the middle attacks)

#### OSP.KEY\_STORAGE

The TOE shall allow storage of cryptographic keys in such a way they are protected from modification or disclosure.

#### **OSP.SYMMETRIC ENCRYPTION**

The TOE shall allow protecting the confidentiality of information represented by user data which may get known by an attacker using a symmetric encryption algorithm.

#### OSP.RSA PRIVATE KEY OPERATION

The TOE shall allow performing the following operation using an RSA private key:

- RSA signature with PKCS#1.5 padding
- RSA decryption with PKCS#1.5 or PKCS#1.5-OAEP padding

#### 3.4.3 **SECURITY ENSURING OSP**

#### **OSP.LOCAL AUTHENTICATION**

Users must be authenticated prior to accessing any controlled TOE resources with the exception of read access to public objects. After a pre-defined authentication failures number, access to controlled resources shall be blocked.

Authentication may be performed by:

- User entered security code verification;
- PUK code verification (only if the TOE is in BLOCKED state)
- Automatic authentication by the driver using an ephemeral security code which must have been generated by the TOE;
- Implicit authentication by proof of knowledge of secrets for the secure communication channel with the TOE. This last case allows only a limited usage of the TOE.

#### **OSP.PUK UNBLOCK**

User can unblock access to TOE controlled resources by using a PUK code. Any PUK code may only be used once. After a pre-defined PUK entry failures sensitive data shall be wiped.

#### OSP.DATA\_WIPE

The TOE provides a way to wipe controlled sensitive assets.

# OSP.ACCESS\_CONTROL

The TOE must limit the extent of each user's abilities to use the TOE functions in accordance with the current TOE authentication state.

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2		Cryptosmart applet 5.1 - Public	c Security-
<b>E</b> com	Public Security Target		<b>29/</b> 92

# OSP.TOE\_AUDIT

The TOE provides an interface to the hosted application, which allows peeking in its internal state. Moreover the TOE informs the host of occurred security events in order for the host to record them in a security journal. Reported security events shall include:

- User authentication failure
- Mutual authentication and session key establishment faults
- Cryptographic errors

Ed : 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2	oryptosmart oard 5.1	Cryptosmart applet 5.1 - Public Security-	
<b>E</b> com	Public Security Target		<b>30/</b> 92

# 4. SECURITY OBJECTIVES

#### 4.1 SECURITY OBJECTIVES FOR THE TOE

This section defines the security objectives for the composite TOE. They are satisfied either by technical countermeasure implemented by the Cryptosmart applet, by the platform or by a combination of the two.

#### O.USER AUTHENTICATION

The TOE shall authenticate the user before providing access to any controlled resources with the exception of read access to card state or APDU encryption initialization.

Authentication shall be performed by:

- User entered security code verification;
- PUK code verification (only if the TOE is in BLOCKED state)
- Automatic authentication by the driver using an ephemeral security code which must have been generated by the TOE;
- Implicit authentication by proof of knowledge of secrets for the secure communication channel with the TOE. This last case allows only a limited usage of the TOE.

This objective does not apply to TOE administrator which may only use the TOE in PERSONALIZATION state.

#### O.PUK\_UNBLOCK

When in BLOCKED state the TOE shall allow the user to unblock it by usage of a PUK code. PUK codes must have been generated by the TOE.

Each PUK code may only be successfully used once.

#### **O.STRONG SECCODE**

The TOE shall restrict the choice of the user security code according to administrator defined minimum length.

The TOE shall restrict PUK codes and ephemeral security codes to TOE generated secrets.

## O.LIMITED\_AUTH\_NUMBER

The TOE shall go in BLOCKED state after 3 successive failed security code entries.

The TOE shall go in WIPED state after 10 failed PUK code entries.

The TOE shall manage only 15 PUK codes. When the card is blocked and no PUK codes are available the TOE shall go in WIPED state.

#### O.FUNCTION ACCESS CONTROL

The TOE shall restrict the access to its services, depending on the TOE state and the services explicitly assigned to this state. Assignment of services to state shall be done by default and may not be changed.

#### O.CRYPTOGRAPHIC\_OPERATION

The TOE shall ensure the cryptographic quality of random number generation. For instance random numbers shall not be predictable and shall have sufficient entropy.

The TOE shall perform valid AES encryption and decryption, MAC signature, RSA signature and decryption.

# O.STRONG\_MUTUAL\_AUTHENTICATION

The TOE shall provide cryptographic functions to authenticate remote users and to negotiate a shared secret key.

The TOE shall make impossible for an online attacker to get knowledge of the session key negotiated with the remote card whose identifier is furnished by the TOE, even if he later acquires knowledge of

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2	- 7,	Cryptosmart applet 5.1 - Public Security-	
<b>E</b> com	Public Security Target		31/92

the private RSA keys of both cards and if he has intercepted all the flows between cards of the same family before and after the session.

An online attacker must be unable to cause the TOE to run successfully the authentication protocol without a valid certificate (even without getting knowledge of the negotiated key).

#### O.KEY\_MANAGEMENT

The TOE shall provide a means to securely manage and store user keys (D.USER\_STORED\_KEYS and D.USER\_SIGNATURE\_KEY). This concerns the correct generation, access and destruction of cryptographic keys. This includes:

- Keys shall be generated in accordance with specified cryptographic key generation algorithms and specified cryptographic key sizes;
- The TOE shall be able to import and store user keys;
- User keys shall be associated with security attributes. Assignment of security attribute to a key shall be done by explicit action of the TOE administrator or TOE user or by default.
- User may only change security attributes to more restrictive values
- The TOE shall restrict the access to the user keys according to their security attributes and the TOE state.
- Keys shall be destroyed in accordance with specified cryptographic key destruction methods.

#### O.PROTECT SESSION KEY

The TOE shall make impossible for an attacker to recover session keys (D.SESSION\_KEYS) when stored by the host.

The TOE shall make impossible for an attacker to modify session keys when stored by the host without detection.

#### O.APDU ENCRYPTION

The TOE shall provide an encryption mechanism to protect the confidentiality and integrity of commands to and responses from the TOE.

The TOE shall encrypt every response when in VALIDATED\_USER, RESUMABLE or RESUMED\_USER state if the command was sent encrypted with the exception of mutual authentication packets.

In VALIDATED\_USER, RESUMABLE or RESUMED\_USER state every command sent in plaintext shall be refused; with the exception of read access to card state or APDU encryption initialization.

# O.SENSITIVE\_MEMORY\_ERASING

The TOE shall erase by zeroization sensitive assets that are not currently in use:

- session key after usage;
- security code when card is blocked;
- ephemeral security code on ephemeral security code entry error;
- PUK code after usage

#### O.WIPE

The TOE shall be able to wipe every personalization data (except the recycle key) and user keys. Wipe shall be initiated:

- On user request, or
- When the PUK codes tries limits is reached, or
- When the TOE has no available PUK code and the security code tries limit has been reached.

#### SECURITY OBJECTIVES FROM THE PLATFORM

Some threats defined in this security target are covered totally or partially by security objectives from the javacard platform. These security objectives are:

# O.EMSEC

The TOE shall control the production of intelligible emanations within specified limits

Ed : 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2		Cryptosmart applet 5.1 - Pul	olic Security-
<b>E</b> com	Public Security Target		<b>32/</b> 92

#### O.TAMPER DETECTION

The TOE provides system features that detect physical tampering of a system component, and use those features to limit security breaches

#### O.TAMPER RESISTANCE

The TOE prevents or resists physical tampering with specified system devices and components.

#### 4.2 SECURITY OBJECTIVES FOR THE ENVIRONMENT

#### **OE.ADMIN**

The card administrator shall not be careless, willfully negligent, or hostile, and shall follow the instructions provided by the administrator documentation.

#### OE.CARD\_ADMIN\_STATION

The card admin station must check the consistency of data injected inside the TOE in PERSONALIZATION state.

#### **OE.KEY GENERATOR**

The keys injected inside the TOE must have been generated by a key generator which mechanisms conform to rules and recommendation from [KEY\_ANSSI].

#### **OE.SECURE PERSONALIZATION**

The TOE personalization (injection of user keys, user certificate, recycle key and family key) must be performed in an environment not accessible physically or remotely by an attacker.

#### OE.SECURE\_KEY\_MANAGEMENT

Externally generated TOE sensitive data (such as user keys, user certificate, family key, recycle key, etc.) must be transmitted to the card administrator in a secure way, and stored in an environment not accessible physically or remotely by an attacker.

# OE.SECURE\_SECCODE\_ENTRY

The user enters or changes his security code only in a safe environment, with no one able to see the security code. In case of compromising suspicion, the user changes its code immediately.

#### **OE.NON TRIVIAL SECCODE**

The user security code shall be non-guessable (i.e. different from "0000", "1234" or analog values). The TOE administrator shall have set a strictly positive minimal length for the user security code.

#### **OE.HOST CORRECT BEHAVIOR**

The host behaves as expected. In particular:

- while running the Cryptosmart authentication protocols it correctly verifies that the distant certificate is valid and bound to the expected distant user's identity;
- while running the stateless Cryptosmart authentication protocol it correctly manages the exported TOE state
- it does not leak the APDU encryption key. Moreover the host shall detect and inform the user when the APDU encryption initialization key has changed.

# OE.HOST\_AUDIT

The host records in a security journal occurred security events such as:

- User authentication failure
- Mutual authentication and session key establishment faults
- Cryptographic errors

This journal is generated from error codes returned by the TOE.

# 5. SECURITY REQUIREMENTS

This section defines the security requirements satisfied by the TOE.

The SFR are grouped under the security objective they cover. First are presented the SFR directly enforcing the security objective, then the dependencies of these SFR. SFR which are dependencies for several other SFRs are grouped together § 5.2.13.

#### **5.1 EXTENDED FAMILY**

#### 5.1.1 **DEFINITION OF FPT\_EMSEC**

The sensitive family FPT\_EMSEC (TOE Emanation) of the Class FPT (Protection of the TSF) is defined here to describe the IT security functional requirements of the TOE. The TOE shall prevent attacks against the TOE and other secret data where the attack is based on external observable physical phenomena of the TOE. Examples of such attacks are evaluation of TOE's electromagnetic radiation, simple power analysis (SPA), differential power analysis (DPA), timing attacks, etc. This family describes the functional requirements for the limitation of intelligible emanations which are not directly addressed by any other component of CC part 2.

The family "TOE Emanation (FPT\_EMSEC)" is specified as follows.

#### Family behaviour

This family defines requirements to mitigate intelligible emanations.

# Component levelling:

FPT_EMSEC TOE emanation		1	
-------------------------	--	---	--

FPT\_EMSEC.1 TOE emanation has two constituents:

FPT\_EMSEC.1.1 Limit of Emissions requires to not emit intelligible emissions enabling access

to TSF data or user data.

FPT EMSEC.1.2 Interface Emanation requires to not emit interface emanation enabling access

to TSF data or user data.

Management: FPT\_EMSEC.1

There are no management activities foreseen.

Audit: FPT EMSEC.1

There are no actions defined to be auditable.

FPT_EMSEC.1 TOE Emanation		
Hierarchical to:	No other components.	
Dependencies:	No dependencies.	
FPT_EMSEC.1.1	The TOE shall not emit [assignment: types of emissions] in excess of [assignment: specified limits] enabling access to [assignment: list of types of TSF data] and [assignment: list of types of user data].	
FPT_EMSEC.1.2	The TSF shall ensure [assignment: type of users] are unable to use the following interface [assignment: type of connection] to gain access to [assignment: list of types of TSF data] and [assignment: list of types of user data].	

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016

<b>E</b> com	Public Security Target		<b>35/</b> 92

# **5.2 SECURITY FUNCTIONAL REQUIREMENTS**

# 5.2.1 O.USER\_AUTHENTICATION ENFORCING SFR

USER ATTRIBUTE DEFINITION (FIA\_ATD)

FIA_ATD.1 User attribute definition		
Hierarchical to:	No other components.	
Dependencies:	No dependencies.	
FIA_ATD.1.1	The TSF shall maintain the following list of security attributes belonging to individual users:  - security code; - security code failed entries counter; - user security code block flag; - PUK code number; - PUK code failed entries counter; - authenticated state (not authenticated, authenticated or light authenticated); - ephemeral security code;  ].	

# USER AUTHENTICATION (FIA\_UAU)

FIA_UAU.1 Timing of authentication				
Hierarchical to:	No other components.			
Dependencies:	FIA_UID.1 Timing of identification			
FIA_UAU.1.1	The TSF shall allow [			
	Get card information;			
	Enter the security code;			
	Card recycling;			
	Card wiping;			
	Initializing the APDU encryption key;			
	Renew the APDU encryption IV;			
	Usage of the TOE if it is in the PRE-PERSONALIZATION state			
	Usage of the TOE if it is in the PERSONALIZATION state			
	] on behalf of the user to be performed before the user is authenticated.			
FIA_UAU.1.2	The TSF shall require each user to be successfully authenticated before allowing any other TSF-mediated actions on behalf of that user.			

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2		Cryptosmart applet 5.1 - Pul	olic Security-
<b>E</b> com	Public Security Target		<b>36/</b> 92

	FIA_UAU.5 Multiple authentication mechanisms				
Hierarchical to:	No other components.				
Dependencies:	No dependencies.				
FIA_UAU.5.1	The TSF shall provide [				
	<ul> <li>Authentication through security code presentation</li> <li>Authentication through ephemeral security code presentation</li> <li>Authentication through PUK code presentation</li> <li>Light authentication by successful usage of the trusted channel with the resume command</li> <li>I to support user authentication</li> </ul>				
FIA_UAU.5.2	The TSF shall authenticate any user's claimed identity according to the [current TOE sta and expected TOE state after authentication :				
	<ul> <li>From UNVALIDATED_USER, RESUMABLE or RESUMED_USER to VALIDATED_USER state by using "Authentication through security code presentation"</li> <li>From RESUMABLE to VALIDATED_USER state by using "Authentication through ephemeral security code presentation"</li> <li>From BLOCKED to VALIDATED_USER state by using "Authentication through PUK code presentation"</li> <li>From RESUMABLE to RESUMED_USER state by using "Light authentication by successful usage of the trusted channel with the resume command"</li> </ul>				

### 5.2.2 O.PUK\_UNBLOCK ENFORCING SFR

This objective is handled by the "FIA\_UAU.5 Multiple authentication mechanisms": the TOE is unblocked by authentication by PUK codes.

This last SFR ensures PUK codes may only be used once:

# USER AUTHENTICATION (FIA\_UAU)

FIA_UAU.4 Single-use authentication mechanisms			
Hierarchical to:	No other components.		
Dependencies:	No dependencies.		
FIA_UAU.4.1	The TSF shall prevent reuse of authentication data related to [authentication through PUK code presentation].		

# 5.2.3 O.STRONG\_SECCODE ENFORCING SFR

SPECIFICATION OF SECRETS (FIA\_SOS)

FIA_SOS.1 Verification of secrets			
Hierarchical to:	No other components.		
Dependencies:	No dependencies.		
FIA_SOS.1.1	The TSF shall provide a mechanism to verify that secrets meet [secret'slength requirements].		

**Application note**: user security code must have a length comprised between 4 and 8 characters. In PERSONALIZATIONstate, the minimum security code length may have been set to a value greater than 4 by

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016			
Ver. : 5.1.2		Cryptosmart applet 5.1 - Pub	lic Security-		
<b>E</b> com	Public Security Target		37/92		

the administrator. The security code may have a 0 length. This last case is explicitly excluded from the evaluation.

FIA_SOS.2 TSF Generation of secrets		
Hierarchical to:	No other components.	
Dependencies:	No dependencies.	
FIA_SOS.2.1	The TSF shall provide a mechanism to generate secrets that meet [indistinguishability from random and length requirement].	
FIA_SOS.2.2	The TSF shall be able to enforce the use of TSF generated secrets for [  • Authentication through ephemeral security code presentation  • Authentication through PUK code presentation  ].	

# **Application note:**

- The length requirement for ephemeral security code is fixed to 8 bytes and may not be changed.
- The length requirement for PUK code is fixed to 8 digits and may not be changed

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016				
Ver. : 5.1.2		Cryptosmart applet 5.1 - Pul	olic Security-			
<b>E</b> com	Public Security Target		38/92			

# 5.2.4 O.LIMITED\_AUTH\_NUMBER ENFORCING SFR

AUTHENTICATION FAILURES (FIA\_AFL)

	FIA_AFL.1 Authentication failure handling	
Hierarchical to:	No other components.	
Dependencies:	FIA_UAU.1 Timing of authentication	
FIA_AFL.1.1/userSC	The TSF shall detect when [3] unsuccessful authentication attempts occur related to [user authentication by security code].	
FIA_AFL.1.2/userSC	When the defined number of unsuccessful authentication attempts has been [met], the TSF shall [	
	<ul> <li>turn the TOE to the BLOCKED state if a PUK code is available</li> <li>turn the TOE to the WIPED state if no PUK code are available ].</li> </ul>	
FIA_AFL.1.1/ephSC	The TSF shall detect when [1] unsuccessful authentication attempts occur related to [user authentication by ephemeral security code].	
FIA_AFL.1.2/ephSC	When the defined number of unsuccessful authentication attempts has been [met], ne TSF shall [wipe the stored ephemeral security code].	
FIA_AFL.1.1/PUK	The TSF shall detect when [10] unsuccessful authentication attempts occur related to [user authentication by PUK code].	
FIA_AFL.1.2/PUK	When the defined number of unsuccessful authentication attempts has been [met], the TSF shall [turn the TOE to the WIPED state].

# 5.2.5 O.FUNCTION\_ACCESS\_CONTROL ENFORCING SFR

The TOE checks access rights for every command based on its current state. This part aims at defining the SFP which has this effect.

## ACCESS CONTROL POLICY (FDP\_ACC)

FDP_ACC.2/access Complete access control						
Hierarchical to:	FDP_ACC.1 Subset access control					
Dependencies:	FDP_ACF.1 Security attribute based access control					
FDP_ACC.2.1/access	The TSF shall enforce the [SFP_OPERATION_ACCESS_CONTROL access control SFP] on [					
	subject: local user, administrator;					
	objects:TOE part 2]					
	and all operations among subjects and objects covered by the SFP.					
FDP_ACC.2.2/access	The TSF shall ensure that all operations between any subject controlled by the TSF and any object controlled by the TSF are covered by an access control SFP.					

The subject (the local user or administrator) operates (sends a command) an object (the Cryptosmart applet, i.e. TOE part 2).

There is only one possible operation between TOE part 2 and the local user or administrator which is sending a command as an APDU.

EachCryptosmart command possesses an attribute per TOE state which is a Boolean representing its authorization for this state.

This SFP aims at verifying whether the operation is authorized or not based on the command function identifier and the TOE state.

### ACCESS CONTROL FUNCTIONS (FDP\_ACF)

FI	FDP_ACF.1/access Security attribute based access control			
Hierarchical to:	No other components.			
Dependencies:	<ul> <li>FDP_ACC.1 Subset access control</li> <li>FMT_MSA.3 Static attribute initialization</li> </ul>			
FDP_ACF.1.1/access	The TSF shall enforce the [SFP_OPERATION_ACCESS_CONTROL access control SFP] to objects based on the following: [the TOE state and related operation authorization].			
FDP_ACF.1.2/access	The TSF shall enforce the following rules to determine if an operation among controlled subjects and controlled objects is allowed: [the authorization attribute for the command is set to true for the current TOE state, as stated in Table 3].			
FDP_ACF.1.3/access	The TSF shall explicitly authorize access of subjects to objects based on the following additional rules: [none].			
FDP_ACF.1.4/access	The TSF shall explicitly deny access of subjects to objects based on the following additional rules: [none].

### 5.2.6 O.CRYPTOGRAPHIC\_OPERATION ENFORCING SFR

CRYPTOGRAPHIC OPERATION (FCS\_COP)

	FCS_COP.1 Cryptographic operation		
Hierarchical to:	No other components.		
Dependencies:	<ul> <li>[FDP_ITC.1 Import of user data without security attributes, or FDP_ITC.2 Import of user data with security attributes, or FCS_CKM.1 Cryptographic key generation]</li> <li>FCS_CKM.4 Cryptographic key destruction</li> </ul>		
FCS_COP.1.1/AES	The TSF shall perform[Encryption and decryption] in accordance with a specified cryptographic algorithm [AES] and cryptographic key sizes [256 and 128 bits] that meet the following: [FIPS PUB 197]		
FCS_COP.1.1/SHA256	The TSF shall perform[MessageDigest computation]in accordance with a specified cryptographic algorithm [SHA256] and cryptographic key sizes [none] that meet the following: [FIPS PUB 180-4]		
FCS_COP.1.1/HMAC	The TSF shall perform[MAC generation and verification]in accordance with a specified cryptographic algorithm [HMAC-SHA256] and cryptographic key sizes [256 and 128 bits] that meet the following: [FIPS PUB 198-1]		
FCS_COP.1.1/EMAC	The TSF shall perform[MAC generation and verification]in accordance with a specified cryptographic algorithm [Retailed AES CBC-MAC] and cryptographic key sizes [256 bits] that meet the following: [none]		
FCS_COP.1.1/RSA_sig	The TSF shall perform[signature] in accordance with a specified cryptographic algorithm [RSA] and cryptographic key sizes [2048 bits] that meet the following: [PKCS #1 v2.1]		
FCS_COP.1.1/RSA_enc	The TSF shall perform[decryption] in accordance with a specified cryptographic algorithm [RSA] and cryptographic key sizes [2048 bits] that meet the following: [PKCS #1 v2.1]		
FCS_COP.1.1/random	The TSF shall perform[random number generation] in accordance with a specified cryptographic algorithm [True random generator post-processed with AES] and cryptographic key sizes [128 bits] that meet the following: [none]		
FCS_COP.1.1/DH	The TSF shall perform[key agreement] in accordance with a specified cryptographic algorithm [Diffie-Hellman] and cryptographic key sizes [2048 bits] that meet the following: [PKCS #3]		

# 5.2.7 O.STRONG\_MUTUAL\_AUTHENTICATION ENFORCING SFR

The mutual authentication is performed using the Cryptosmart authentication protocol. This protocol is based on the following SFR:

- FCS\_COP.1.1/random
- FCS\_COP.1.1/DH
- FCS\_COP.1.1/RSA\_sig
- FCS\_COP.1.1/HMAC
- FCS\_COP.1.1/SHA256
- FCS\_COP.1.1/AES
- FCS\_COP.1.1/EMAC

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016		
Ver. : 5.1.2		Cryptosmart applet 5.1 - Public Security-		
<b>E</b> com	Public Security Target		44/92	

# 5.2.8 O.KEY\_MANAGEMENT ENFORCING SFR

### **5.2.8.1** KEY GENERATION AND IMPORT

CRYPTOGRAPHIC KEY MANAGEMENT (FCS\_CKM)

	FCS_CKM.1 Cryptographic key generation		
Hierarchical to:	No other components.		
Dependencies:	<ul> <li>[FCS_CKM.2 Cryptographic key distribution, or FCS_COP.1 Cryptographic operation]</li> <li>FCS_CKM.4 Cryptographic key destruction</li> </ul>		
FCS_CKM.1.1/RSA	The TSF shall generate cryptographic keys in accordance with a specified cryptographic key generation algorithm [Javacard API RSA key pair generation] and specified cryptographic key sizes [2048 bits] that meet the following: [none].		
FCS_CKM.1.1/random	The TSF shall generate cryptographic keys in accordance with a specified cryptographic key generation algorithm [random generation] and specified cryptographic key sizes [128 bits and 256 bits] that meet the following: [none].		
FCS_CKM.1.1/local_prot	The TSF shall generate cryptographic keys in accordance with a specified cryptographic key generation algorithm [hash with constant] and specified cryptographic key sizes [256 bits] that meet the following: [none].		

# IMPORT FROM OUTSIDE OF THE TOE (FDP\_ITC)

	FDP_ITC.2/keys Import of user data with security attributes	
Hierarchical to:	No other components.	
Dependencies:	[FDP_ACC.1 Subset access control, or FDP_IFC.1 Subset information flow control]	
	[FTP_ITC.1 Inter-TSF trusted channel, or FTP_TRP.1 Trusted path]	
	FPT_TDC.1 Inter-TSF basic TSF data consistency	
FDP_ITC.2.1/keys	The TSF shall enforce the [SFP_KEY_ACCESS_CONTROL access control SFP] when importing user data, controlled under the SFP, from outside of the TOE.	
FDP_ITC.2.2/keys	The TSF shall use the security attributes associated with the imported user data.	
FDP_ITC.2.3/keys	The TSF shall ensure that the protocol used provides for the unambiguous association between the security attributes and the user data received.	
FDP_ITC.2.4/keys	The TSF shall ensure that interpretation of the security attributes of the imported user data is as intended by the source of the user data.	
FDP_ITC.2.5/keys	The TSF shall enforce the following rules when importing user data controlled under the SFP from outside the TOE: [none].	

**Application note:** When the administrator imports user keys in the TOE, there is no usage of any trusted path as the security of the communication link is ensured by the environment.

#### 5.2.8.2 KEY DESTRUCTION

### CRYPTOGRAPHIC KEY MANAGEMENT (FCS\_CKM)

FCS_CKM.4 Cryptographic key destruction		
Hierarchical to:	No other components.	
Dependencies:	<ul> <li>[FDP_ITC.1 Import of user data without security attributes, or FDP_ITC.2 Import of user data with security attributes, or FCS_CKM.1 Cryptographic key generation]</li> </ul>	
FCS_CKM.4.1/zero	The TSF shall destroy cryptographic keys in accordance with a specified cryptographic key destruction method [zeroization] that meets the following: [none].	
FCS_CKM.4.1/java	he TSF shall destroy cryptographic keys in accordance with a specified ryptographic key destruction method [The keys are reset in accordance with [JCAPI] in class Key with the method clearKey()] that meets the following: [JCAPI].	

**Application note**: The SFR FCS\_CKM.4.1/java only applies to keys stored in javacard Key objects. The SFR FCS\_CKM.4.1/zero applies to keys stored as arrays.

#### 5.2.8.3 SECURITY ATTRIBUTES AND ACCESS CONTROL

This section defines a SFP on Ob.USER\_STORED\_KEYS, Ob.USER\_SIGNATURE\_KEY and Ob.APDU\_INITIALIZATION\_KEY objects.

These objects are defined as:

- Ob.USER\_STORED\_KEYS corresponds to the D.USER\_STORED\_KEYS asset
- Ob.USER\_SIGNATURE\_KEYcorresponds to the D.USER\_SIGNATURE\_KEY asset
- Ob.APDU\_INITIALIZATION\_KEYcorresponds to the APDU initialization key which is part of the D.TOE INTERNAL DATA asset

These objects have the following attributes considered in this SFP:

- Key identifier
- Key type (symmetric or RSA)
- Useable in resume flag
- The "encryption" key usage flag
- The "sign" key usage flag
- Extractable flag
- The "disable security checks" flag
- A usage counter

**Note**: for asymmetric keys the key usage, "disable security checks" flags and usage counter are ignored (cf. FDP\_ACF.1/keys)and are therefore not implemented.

The possible operations on these objects are:

- Generation;
- Deletion;
- Import inside the TOE
- Export from the TOE
- Encrypt or decrypt
- Sign

Ver. : 5.1.2	Gryptosmart card 3.1	Cryptosmart applet 5.1 - Publ	ic Security-
<b>E</b> com	Public Security Target		46/92

# ACCESS CONTROL POLICY (FDP\_ACC)

FDP_ACC.2/keys Complete access control		
Hierarchical to:	FDP_ACC.1 Subset access control	
Dependencies:	FDP_ACF.1 Security attribute based access control	
FDP_ACC.2.1/keys	The TSF shall enforce the [SFP_KEY_ACCESS_CONTROL access control SFP] on [  subject: local user, administrator;  objects:Ob.USER_STORED_KEYS, Ob.USER_SIGNATURE_KEY and Ob.APDU_INITIALIZATION_KEY]  and all operations among subjects and objects covered by the SFP.	
FDP_ACC.2.2/keys	The TSF shall ensure that all operations between any subject controlled by the TSF and any object controlled by the TSF are covered by an access control SFP.	

ACCESS CONTROL FUNCTIONS (FDP\_ACF)

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2	oryptosinart data 5.1	Cryptosmart applet 5.1 - Pub	olic Security-
<b>E</b> com	Public Security Target		47/92

FDP_ACF.1/keys Security attribute based access control	
Hierarchical to:	No other components.
Dependencies:	<ul> <li>FDP_ACC.1 Subset access control</li> <li>FMT_MSA.3 Static attribute initialization</li> </ul>
FDP_ACF.1.1/keys	The TSF shall enforce the [SFP_KEY_ACCESS_CONTROL access control SFP] to objects based on the following: [TOE state and object attribute].
FDP_ACF.1.2/keys	The TSF shall enforce the following rules to determine if an operation among controlled subjects and controlled objects is allowed: [
	<ul> <li>Generation or import operation are allowed only if no object with same identifier and key type already exists;</li> <li>Export operation is always denied if the extractable attribute is set to false;</li> <li>Any operation is always denied if the TOE is in RESUMED_USER state and the "usable in resumed" attribute is set to false;</li> <li>Local protection key obtention is authorized only if the key type is symmetric and the key identifier attribute is 0 or 1</li> <li>The encrypt or decrypt operation is authorized only if</li> </ul>
	<ul> <li>The key type is asymmetric and the key identifier attribute is different from 0 or 1, or</li> <li>The key type is symmetric and the "encryption" key usage attribute is set to true</li> <li>The sign operation is authorized only if</li> <li>The key type is asymmetric and the key identifier attribute is different from 0 or 1, or</li> <li>The key type is symmetric and the "sign" key usage attribute is set to true</li> </ul>
FDP_ACF.1.3/keys	The TSF shall explicitly authorize access of subjects to objects based on the following additional rules: [none].
FDP_ACF.1.4/keys	The TSF shall explicitly deny access of subjects to objects based on the following additional rules: [
	The encrypt or decrypt operation is refused if the "disable security checks" key attribute is set to false and the usage counter as reached 10.000  ].

# EXPORT FROM THE TOE (FDP\_ETC)

FDP_ETC.1/keys Export of user data without security attributes	
Hierarchical to:	No other components.
Dependencies:	[FDP_ACC.1 Subset access control, or FDP_IFC.1 Subset information flow control]
FDP_ETC.1.1/keys	The TSF shall enforce the [SFP_KEY_ACCESS_CONTROL access control SFP] when exporting user data, controlled under the SFP(s), outside of the TOE.
FDP_ETC.1.2/keys	The TSF shall export the user data without the user data's associated security attributes

# MANAGEMENT OF SECURITY ATTRIBUTES (FMT\_MSA)

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2	отурновная одна от г	Cryptosmart applet 5.1 - Public Security-	
<b>E</b> com	Public Security Target		<b>48/</b> 92

FMT_MSA.1/keys Management of security attributes		
Hierarchical to:	No other components.	
Dependencies:	[FDP_ACC.1 Subset access control, or FDP_IFC.1 Subset information flow control]	
	FMT_SMR.1 Security roles	
	FMT_SMF.1 Specification of Management Functions	
FMT_MSA.1.1/keys	The TSF shall enforce the [SFP_OPERATION_ACCESS_CONTROL access control SFP] to restrict the ability to [modify] the security attributes [Useable in resume, Extractable, "encryption" and "sign" key usage] to [user, administrator].	

FMT_MSA.2/keys Secure security attributes		
Hierarchical to:	No other components.	
Dependencies:	[FDP_ACC.1 Subset access control, or FDP_IFC.1 Subset information flow control]	
	FMT_MSA.1 Management of security attributes	
	FMT_SMR.1 Security roles	
FMT_MSA.2/keys	The TSF shall ensure that only secure values are accepted for [Extractable, usable in resumed, "encryption" and "sign" key usage attributes].	

### Application note: This SFR applies:

- On key creation:
  - For keys with identifier 0 or 1 only fixed values are accepted, i.e. the "extractable", "encryption" and "sign" key usage attributes must be set to false, and the "usable in resumed" must be set to false for key with identifier 0 and to true for key with identifier 1;
- On attribute change: a user shall not be able to change security attributes to less restrictive ones. He cannot change any flags from false to true. It shall be impossible to allow an object to be exported when export was previously forbidden, or to allow performing previously forbidden operation.

### 5.2.9 O.PROTECT SESSION KEY ENFORCING SFR

Session key are outputted symmetrically wrapped. This is based on already defined SFR FCS\_COP.1.1/AES and FCS\_COP.1.1/EMAC.

Wrapping keys may be either generated internally (FCS\_CKM.1.1/random) or imported inside the TOE.

The FDP\_ITC.2/keys dependency of FCS\_COP.1can't apply as SFP\_KEY\_ACCESS\_CONTROL do not apply to wrapping keys. The following SFR allows fulfilling the dependency for wrapping key import:

IMPORT FROM OUTSIDE OF THE TOE (FDP\_ITC)

FDP_ITC.1/systemkey Import of user data without security attributes		
Hierarchical to:	No other components.	
Dependencies:	<ul> <li>[FDP_ACC.1 Subset access control, or FDP_IFC.1 Subset information flow control]</li> <li>FMT_MSA.3 Static attribute initialization</li> </ul>	
FDP_ITC.1.1/systemkey	The TSF shall enforce the [SFP_OPERATION_ACCESS_CONTROL access control SFPs] when importing user data, controlled under the SFP, from outside of the TOE.	
FDP_ITC.1.2/systemkey	The TSF shall ignore any security attributes associated with the user data when imported from outside the TOE.	
FDP_ITC.1.3/systemkey	The TSF shall enforce the following rules when importing user data controlled under the SFP from outside the TOE: [none].	

The dependency FMT\_MSA.3 will not be fulfilled as the TOE does not define security attribute for wrapping keys: their usage is fully controlled by SFP\_OPERATION\_ACCESS\_CONTROL which provides access control on the functions involving the wrapping key.

<b>E</b> com	Public Security Target		<b>52/</b> 92

### 5.2.11 O.SENSITIVE\_MEMORY\_ERASINGENFORCING SFR

RESIDUAL INFORMATION PROTECTION (FDP\_RIP)

F	FDP_RIP.1 Subset residual information protection		
Hierarchical to:	No other components.		
Dependencies:	No dependencies.		
FDP_RIP.1.1/applet	The TSF shall ensure that any previous information content of a resource is made unavailable upon the [deallocation of the resource from] the following objects: [  • session key  • security code  • ephemeral code  • PUK code  ].		
FDP_RIP.1.1/APDU	The TSF shall ensure that any previous information content of a resource is made unavailable upon the [allocation of the resource to] the following objects: [the APDU Buffer].		
FDP_RIP.1.1/TRANSIENT	The TSF shall ensure that any previous information content of a resource is made unavailable upon the [deallocation of the resource from] the following objects: [any transient object].		

### 5.2.12 O.WIPE ENFORCING SFR

The wipe action is managed by already defined FCS\_CKM.4.1/zero, FCS\_CKM.4.1/java and FDP\_RIP.1:

- User keys are erased using FCS\_CKM.4.1/java;
- Personalization data are respectively erased by:
  - Security codes are erased using FDP\_RIP.1;
  - Keys derived from the family key by FCS\_CKM.4.1/java
  - Wrapping keys by FCS\_CKM.4.1/java;
  - o Local protection master keys by FCS\_CKM.4.1/java

### Wipe can be initiated:

- · On user request.
- When the PUK codes tries limits is reached, which is handled by FIA\_AFL.1/PUK
- When the TOE has no available PUK code and the security code tries limit has been reached which is handled by FIA\_AFL.1/userSC

Ed : 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2		Cryptosmart applet 5.1 - Pul	olic Security-
<b>E</b> com	Public Security Target		53/92

### 5.2.13 O.EMSEC ENFORCING SFR

TOE EMANATION (FPT\_EMSEC)

FPT_EMSEC.1 TOE Emanation	
Hierarchical to:	No other components.
Dependencies:	No dependencies.
FPT_EMSEC.1.1	The TOE shall not emit [side channel emission] in excess of [limits specified by the state-of-the-art attacks on smart card IC] enabling access to [D.SESSION_KEYS, D.USER_SIGNATURE_KEY, D.USER_AUTH_CODE, D.TOE_INTERNAL_DATA and D.APDU_KEYS] and [D.USER_STORED_KEYS].
FPT_EMSEC.1.2	The TSF shall ensure [all users] are unable to use the following interface [external contacts emanations] to gain access to [D.SESSION_KEYS, D.USER_SIGNATURE_KEY, D.USER_AUTH_CODE, D.TOE_INTERNAL_DATA and D.APDU_KEYS] and [D.USER_STORED_KEYS].

# 5.2.14 **O.TAMPER\_DETECTION ENFORCING SFR**

TSF PHYSICAL PROTECTION (FPT\_PHP)

	FPT_PHP.1 Passive detection of physical attack		
Hierarchical to:	No other components.		
Dependencies:	No dependencies.		
FPT_PHP.1.1	The TSF shall provide unambiguous detection of physical tampering that might compromise the TSF.		
FPT_PHP.1.2	The TSF shall provide the capability to determine whether physical tampering with the TSF's devices or TSF's elements has occurred.		

# TSF SELF TEST (FPT\_TST)

FPT_TST.1 TSF testing	
Hierarchical to:	No other components.
Dependencies:	No dependencies.
FPT_TST.1.1	The TSF shall run a suite of self-tests [during initial start-up and periodically during normal operation] to demonstrate the correct operation of [the TSF].
FPT_TST.1.2	The TSF shall provide authorised users with the capability to verify the integrity of [TSF data].
FPT_TST.1.3	The TSF shall provide authorised users with the capability to verify the integrity of [TSF executable code].

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2	21	Cryptosmart applet 5.1 - Pul	blic Security-
<b>E</b> com	Public Security Target		<b>54/</b> 92

#### 5.2.15 O.TAMPER RESISTANCE ENFORCING SFR

FAIL SECURE (FPT\_FLS)

FPT_FLS.1 Failure with preservation of secure state	
Hierarchical to:	No other components.
Dependencies:	No dependencies.
FPT_FLS.1.1	<ul> <li>The TSF shall preserve a secure state when the following types of failures occur: [</li> <li>those associated to the potential security violations described in FAU_ARP.1 of the underlying javacard open platform,</li> <li>the object deletion functions fail to delete all the unreferenced objects owned by the applet that requested the execution of the method,</li> <li>1. Invalid reference exception; 2. Code or data integrity failure; 3. Power loss while processing. 4. worm on or dead EEPROM, full security area, false CRC For each problem the TOE sends a specific exception status or doesn't start].</li> </ul>

**Application note:** Potential security violation described in FAU\_ARP.1 are recalled here as described in [IOC7-ST] for convenience:

- CAP file inconsistency
- Typing error in the operands of a bytecode
- Applet life cycle inconsistency
- Card tearing (unexpected removal of the Card out of the CAD) and power failure
- Abortion of a transaction in an unexpected context (see abortTransaction(), [JCAPI] and [JCRE], §7.6.2)
- Violation of the Firewall or JCVM SFPs
- Unavailability of resources
- Array overflow
- Other runtime errors related to applet's failure (like uncaught exceptions)

### TSF PHYSICAL PROTECTION (FPT\_PHP)

	FPT_PHP.3 Resistance to physical attack	
Hierarchical to:	No other components.	
Dependencies:	No dependencies.	
FPT_PHP.3.1	The TSF shall resist [changing operational conditions every times: the frequency of the external clock, power supply, and temperature] to the [chip elements] by responding automatically such that the SFRs are always enforced	

### 5.2.16 GENERIC DEPENDENCIES SFR

This section groups SFR which are dependencies for different other SFRs.

### USER IDENTIFICATION (FIA\_UID)

**Application note**: as the TOE is single user, user authentication provides identification. Therefore the FIA\_UID dependency does not need to be fulfilled.

# SECURITY MANAGEMENT ROLES (FMT\_SMR)

FMT_SMR.1 Security roles	
Hierarchical to:	No other components.
Dependencies:	FIA_UID.1 Timing of identification
FMT_SMR.1.1	The TSF shall maintain the roles [local user, administrator].
FMT_SMR.1.2	The TSF shall be able to associate users with roles.

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016

<b>E</b> com	Public Security Target		<b>57/</b> 92				

# 6. GLOBAL TOE SPECIFICATION

This chapter provides the TOE summary specification, a high-level definition of the security functions claimed to meet the functional and assurance requirements.

### **6.1 TOE SECURITY FUNCTIONS**

The TOE security functions include the following:

- Identification and authentication (IA): this family includes all functions related to identification and authentication of users and administrators;
- Cryptography (CR): this family includes all cryptography related functions;
- Protection and filtering (PR): this family includes all functions related to protecting user data;
- Security management (GS): this family includes all functions related to managing security policies.
- Platform provided security functions (PTF): this family includes all functions entirely managed by the underlying platform.

### 6.1.1 IDENTIFICATION AND AUTHENTICATION (IA)

#### SF.IA ROLES

The TOE maintains two roles:

- The administrator which is the TOE user while in PERSONALIZATION and WIPED states
- The local user which is the TOE user while in UNVALIDATED\_USER, VALIDATED\_USER, RESUMABLE, RESUMED\_USER and BLOCKED states.

#### SF.IA AUTH PARAMETER

The TOE shall maintain the following elements related to its user:

- The user security code:
- The corresponding failed entries counter;
- The user ephemeral security code;
- The TOE state which includes the security code validation flag and the light unlock validation flag.
- 15 PUK codes
- The current authorized PUK code

### SF.IA\_SECURITY\_CODE

The TOE is able to authenticate the local user by a security code. This security code is composed of numeric characters and has a maximum size of 8 characters. After 3 successive failed attempts, the TOE turns into a BLOCKED state.

The administrator may fix a minimum length requirement, which is set to 4 by default.

The security code must be transmitted to the TOE using the APDU encryption mechanism.

### SF.IA\_PUK\_CODE

The TOE is able to authenticate the local user by a PUK code. This method of authentication is only available if the TOE is in the BLOCKED state. After 10 failed attempts authentication by PUK code is disabled. The TOE must be recycled.

PUK codes are composed of 8 (random) numeric characters generated by the TOE.

Already used PUK codes will be refused.

The PUK code must be entered using the APDU encryption mechanism.

### SF.IA EPHEMERAL SECURITY CODE

The TOE is able to authenticate the local user by an ephemeral security code. This ephemeral security code is composed of numeric characters and has a size of 8 characters. It is generated by the TOE

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016					
Ver. : 5.1.2		Cryptosmart applet 5.1 - Public Security-					
<b>E</b> com	Public Security Target	58/92					

after a successful authentication by security code or PUK code. This security code is re-generated after successive successful re-authentication with the security code or at user request.

Using a wrong ephemeral security code shall cause the TOE to erase the stored (right) ephemeral security code, which disables this authentication mechanism.

Ephemeral security code is composed of 8 (random) numeric characters generated by the TOE when the user has authenticated using his security code or a PUK code..

The ephemeral security code must be entered using the APDU encryption mechanism.

#### SF.IA LIGHT AUTH

The TOE is able to implicitly authenticate the user by successfully sending a correctly formatted resume command using the APDU encryption mechanism, with a null buffer as ephemeral security code argument. Usage of the APDU encryption mechanism proves knowledge of the 128 bits APDU encryption key. After such light authentication the TOE turns into a RESUMED\_USER state which allows limited usage of the TOE.

This kind of authentication is only authorized after a successful security code authentication in case of card loss of power.

### 6.1.2 CRYPTOGRAPHY (CR)

### SF.CR\_STATEFULL\_AUTHENTICATION

The TOE is able to conduct a session key negotiation phase with another card by using a SIGMA-R like protocol. This protocol allows the negotiation of a common secret with a perfect forward secrecy property and authenticates the distant card user. Unpowering the card does cause the protocol to abort.

Once the distant card user has been authenticated and the session key has been generated it is transmitted to the local user under a wrapped form and erased from memory.

### SF.CR\_STATELESS\_AUTHENTICATION

The TOE is able to conduct a session key negotiation phase with another card by using a SIGMA like protocol. This protocol allows the negotiation of a common secret with a perfect forward secrecy property and authenticates the distant card user. Unpowering the card does not cause the protocol to abort.

Once the distant card user has been authenticated and the session key has been generated it is transmitted to the local user under a wrapped form and erased from memory

## SF.CR\_KEY\_DERIVATION

The TOE is able to derive a cryptographic key into several other keys using a cryptographic key derivation mechanism. Once the derivation succeeded the initial key is updated, transmitted to the local user under a wrapped form with the derived keys (in clear) and every key is erased from memory.

#### SF.CR LOCAL PROTECTION KEY

The TOE is able to derive a cryptographic key into several other keys using a cryptographic key derivation mechanism. Once the derivation succeeded the TOE outputs the obtained key to the TOE user.

### SF.CR\_RSA\_ENCRYPT

The TOE is able to decrypt data using the RSA algorithm with PKCS#1.5 or PKCS#1.5-OAEP padding and 2048 bits keys.

# SF.CR\_RSA\_SIGN

The TOE is able to sign data using the RSA algorithm with 2048 bits keys and PKCS#1.5 padding without use of any digest algorithm.

### SF.CR AES

The TOE is able to encrypt and decrypt data using the AES algorithm using 128 or 256 bits keys.

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016					
Ver. : 5.1.2		Cryptosmart applet 5.1 - Pub	lic Security-				
<b>E</b> com	Public Security Target		59/92				

### SF.CR MAC

The TOE is able to perform MAC using HMAC-SHA256 and 128 or 256 bits keys.

The TOE is able to perform MAC using AES in retail CBC MAC mode (EMAC) and 256 bits keys (2\*128).

### SF.CR\_RNG

The TOE is able to generate random numbers using the platform secure random generator post processed using AES with 128 bits keys.

#### SF.CR\_KEY\_GENERATION

The TOE is able to generate cryptographic keys using the following methods:

- RSA keys are generated using the built in javacard generator
- Symmetric keys are generated using the TOE random number generator

#### SF.CR\_KEY\_DESTRUCTION

The TOE destroys cryptographic keys by clearing them in memory.

### 6.1.3 **PROTECTION AND FILTERING (PR)**

### SF.PR\_ACCESS\_RIGHTS

The TOE is able to perform access control for each command sent by the user. This is done by confronting the TOE state to:

• The command access rights.

Access control ensures the local user is authenticated before performing any action except:

- Get card information;
- Enter the security code;
- Card recycling;
- · Card wiping;
- Initializing the APDU encryption key;
- Renew the APDU encryption IV;

The administrator is not required to be authenticated (the administrator may only use the TOE while in PERSONALIZATION state, and security is ensured by the environment in this state).

The command access rights are fixed in TOE code and may not be changed.

# SF.PR\_KEY\_ACCESS\_CONTROL

The TOE is able to perform access control for user keys. This is done by confronting the TOE state to:

• The "extractable" and "useable in resumed" key attributes

Key identifier, key type, extractable and useable in resumed flags attributes must be set by the user at asset creation.

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016					
Ver. : 5.1.2	oryptoomart out a ort	Cryptosmart applet 5.1 - Pul	olic Security-				
<b>E</b> com	Public Security Target		<b>60/</b> 92				

#### SF.PR RESIDUAL WIPE

The TOE erases sensitive data when not needed any more (changed security code, after PUK code usage, etc.).

### SF.PR\_APDU

The TOE offers a trusted channel where every command sent to the TOE in VALIDATED\_USER and RESUMED\_USER state can be AES encrypted and AES based MAC sealed using TOE generated keys.

Usage of this trusted channel is required for:

- initial user authentication;
- any command and TOE response in VALIDATED\_USER, or RESUMED\_USER state, except
  - o response with a "distant card" order or transmission of an authentication packet;
  - o get status command
  - o APDU encryption keys renewal
- the "resume" command in RESUMABLE state

#### 6.1.4 SECURITY MANAGEMENT (GS)

#### SF.GS\_ADMIN

An administrator can perform the following administration operation:

- Set the minimum security code length requirements
- Set the default user security code
- Create the PUK code within the TOE and get them
- Import a recycle key
- Import the SMS wrapping key
- Import, export or generate RSA keys (within the limits of the access control policy)
- Import, export or generate symmetric keys (within the limits of the access control policy)
- Delete RSA or symmetric keys (within the limits of the access control policy)
- Change user key attributes (within the limits of the access control policy)

An administrator may not change access rights to TOE functions.

Data are imported with security attributes: in case of symmetric or RSA keys attributes are specified by the administrator during their import; other data attributes are statically set when imported.

#### SF.GS USER

A user can perform the following administration operation:

- Change its security code
- Import, export or generate RSA keys (within the limits of the access control policy)
- Import, export or generate symmetric keys (within the limits of the access control policy)
- Delete RSA or symmetric keys (within the limits of the access control policy)
- Change user key attributes (within the limits of the access control policy)

A user may not change access rights to TOE functions.

Data are imported with security attributes: symmetric or RSA keys attributes are specified by the user during their import.

## 6.1.5 PLATFORM PROVIDED SECURITY FUNCTIONS (PTF)

### SF.PTF SAFESTATE MGT

This security function performs the following operations:

- Monitoring the integrity of the TOE and the TSF data by performing selftests
- Ensuring the TOE returns in a safe state when an unexpected event occurs (loss of power, tearing): allsensitive data are erased and the TOE returns in a restrictive and secure state.

In case a major error is detected, the security function destroys the TOE.

### SF.PTF PHYS

This security function ensures

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016					
Ver. : 5.1.2		Cryptosmart applet 5.1 - Publ	lic Security-				
<b>E</b> com	Public Security Target		61/92				

- The TOE detects physical manipulation (I/O manipulation, EM perturbation, temperature perturbation) and takes countermeasures.
- The TOE is protected against probing and that there is no information leakage that might be used to reconstruct sensitive data

In case a major error is detected, the security function destroys the TOE.

### T.TOE DATA CORRUPTION

This threat is covered by the following security objectives:

- O.FUNCTION\_ACCESS\_CONTROL: ensureswrite access toassets is controlled by the TOE. An
  attacker may not directly modify them as he must be authenticated to get access to TOE controlled
  assets;
- O.PROTECT\_SESSION\_KEY: ensures that modifications on outputted session keys will be detected;
- O.APDU\_ENCRYPTION: ensures that an attacker may not alter asset while imported in the TOE by the user;
- O.TAMPER\_RESISTANCE: ensures an attacker may not modify assets by physical means;
- OE.SECURE\_PERSONALIZATION: ensures the personalization environment is secure. An attacker
  may not alter asset while imported in the TOE by the admin;
- OE.SECURE\_KEY\_MANAGEMENT: ensures the key are managed in a secure way while out of TOE scope. An attacker may not alter asset while transmitted from key generator to admin; or alter their stored value;
- OE.ADMIN: ensure that the attacker may not be the admin, nor can he corrupt the admin to alter assets;
- OE.CARD\_ADMIN\_STATION: ensures that the assets injected in TOE are consistent (the private key and certificate are correctly related).

### T.TOE DATA COMPROMISE

This threat is covered by the following security objectives:

- O.FUNCTION\_ACCESS\_CONTROL: ensures read access to assets is controlled by the TOE. An
  attacker may not directly get them as he must be authenticated to get access to TOE controlled assets;
- O.PROTECT\_SESSION\_KEY: ensures outputted sessionkeys are protected from disclosure;
- O.APDU\_ENCRYPTION: ensures that an attacker may not eavesdrop assets while imported in the TOE by the user;
- O.SENSITIVE\_MEMORY\_ERASING: ensures that an attacker may not recover previously erased sensitive data
- O.TAMPER\_RESISTANCE: ensures an attacker may not have information on assets by physical means;
- O.EMSEC: ensures an attacker may not have information on assets by side channel analysis;
- OE.SECURE\_PERSONALIZATION: ensures the personalization environment is secure. An attacker
  may not have knowledge of asset while imported in the TOE by the admin;
- OE.SECURE\_KEY\_MANAGEMENT: ensures the key are managed in a secure way while out of TOE scope. An attacker may not have knowledgeof assets while transmitted from key generator to admin; or while stored for backup;
- OE.ADMIN: ensure that the attacker may not be the admin, nor can he corrupt the admin to get assets;
- OE.SECURE\_SECCODE\_ENTRY: ensures that the user security code is not compromised by an attacker while entered;
- OE.HOST\_CORRECT\_BEHAVIOR: ensures that the APDU encryption initialization key is trusted.
   When changed the user is informed and is in measure to refuse to enter his security code if he did not change his Cryptosmart card.
- OE.NON\_TRIVIAL\_SECCODE: ensures that the user security code is not guessable by an attacker

#### T.ABUSE\_FUNC

This threat is covered by the following security objectives:

O.FUNCTION\_ACCESS\_CONTROL: ensures that access to TOE function is controlled by the TOE.
 Functions for personalization may not be abused as they are only accessible in PERSONALIZATION state, and OE.SECURE\_PERSONALIZATION ensures the attacker may not use the TOE.

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2		Cryptosmart applet 5.1 - Publ	ic Security-
<b>E</b> com	Public Security Target		64/92

#### T.PHYSICAL

This threat is covered by the following security objectives:

- O.TAMPER\_DETECTION: ensures that a physical attack is detected (and then appropriate measure can be taken);
- O.TAMPER\_RESISTANCE: ensures an attacker may not have information on assets by physical means:
- O.EMSEC: ensures an attacker may not have information on assets by side channel analysis;

#### T.MASQUERADE

This threat is covered by the following security objectives:

- O.USER\_AUTHENTICATION which states that authorized data sources must be authenticated preventing than attacker to impersonate a legitimate user;
- O.APDU\_ENCRYPTION which links every command to a previous successful authentication. An attacker may not send commands to the TOE by getting control of the communication link after the user has authenticated to the TOE;
- O.KEY\_MANAGEMENT and O.FUNCTION\_ACCESS\_CONTROL which define security attributes based access control. This restricts access to keys according to TOE state and key security attributes (the TOE state is related to the fact that the user is authenticated, and how he had authenticated).

### T.KEY\_DERIVE

This threat is covered by the following security objectives:

- O.CRYPTOGRAPHIC\_OPERATION and OE.KEY\_GENERATOR ensure that generated keys have sufficient entropy generated by the TOE or not. The attacker may not bruteforce them.
- O.CRYPTOGRAPHIC\_OPERATION ensures that RSA keys are generated using a cryptographically correct algorithm. This prevents the attacker to mount a mathematical attack on these keys.

### T.INTERFACE, EAVESDROP

O.APDU\_ENCRYPTION directly covers this threat by protecting the confidentiality of data transmitted by the user to the TOE and reciprocally.

OE.HOST\_CORRECT\_BEHAVIOR covers this threat by ensuring that the APDU encryption initialization key is trusted. When changed the user is informed and is in measure to refuse to enter his security code if he did not change his Cryptosmart card. This avoids the possibility of man in the middle when APDU encryption is initialized.

## OSP.RGS\_CRYPTO

The objective O.CRYPTOGRAPHIC\_OPERATION ensures that cryptographic algorithms and key generation algorithms conform to the RGS.

### OSP.MUTUAL\_AUTHENTICATION

This OSP is covered by the following security objectives:

- O.STRONG\_MUTUAL\_AUTHENTICATION which directly cover the OSP by providing the possibility for the user to run an authentication protocol;
- OE.HOST\_CORRECT\_BEHAVIOR which ensures that the certificate verification is performed correctly.
- OE.CARD\_ADMIN\_STATION which ensures that assets injected in TOE are consistent (private key
  and certificate): users are authenticated using the certificate related to the private key used in protocol.
  (this only allows the protocol to successfully run. Otherwise it would always fail at certificate or
  signature verification)

### OSP.KEY\_STORAGE

This OSP is covered by the following security objectives:

Ed: 2010B/346	Cryptosmart card 5.1 November 7, 2016					
Ver. : 5.1.2	- //	Cryptosmart applet 5.1 - Public Security-				
<b>E</b> com	Public Security Target		<b>65/</b> 92			

- O.KEY\_MANAGEMENT and O.FUNCTION\_ACCESS\_CONTROLwhich enable a strong security attributes based access control
- The security objectivesfrom the platform O.TAMPER\_DETECTION and O.TAMPER\_RESISTANCE which providesphysical protection to stored keys
- The security objective from the platform O.EMSEC which ensures keys may not be recovered by side channel analysis

### OSP.SYMMETRIC ENCRYPTION

The objective O.CRYPTOGRAPHIC\_OPERATION directly covers this OSP.

### OSP.SYMMETRIC\_INTEGRITY

The objective O.CRYPTOGRAPHIC\_OPERATION directly covers this OSP.

#### OSP.RSA\_PRIVATE\_KEY\_OPERATION

The objective O.CRYPTOGRAPHIC OPERATION directly covers this OSP.

#### OSP.LOCAL\_AUTHENTICATION

The objectiveO.USER\_AUTHENTICATIONdirectly answers to the first part of the OSP (the user must be authenticated before performing sensitive action)

The objective O.STRONG\_SECCODE ensures an attacker may not guess the security code, allowing to falsely authenticating to the TOE

The objective O.LIMITED\_AUTH\_NUMBERdirectly answers to the second part of the OSP concerning authentication error handling.

#### OSP.PUK\_UNBLOCK

The objective O.PUK\_UNBLOCK provides the ability to unblock the TOE

The objective O.CRYPTOGRAPHIC\_OPERATION ensures an attacker may not guess PUK code as they are TOE generated

The objectives O.LIMITED\_AUTH\_NUMBER and O.WIPE directly answer to the second part of the OSP concerning PUK authentication error handling.

## OSP.DATA\_WIPE

The objective O. WIPE directly covers this OSP.

#### OSP.ACCESS CONTROL

The objective O.FUNCTION\_ACCESS\_CONTROL covers this OSP by providing function access control.

The objective O.KEY\_MANAGEMENT strengthens the coverage of this OSP for user keys by providing a second level of access control for user keys.

### OSP.TOE\_AUDIT

This OSP is directly covered by the objective on the environment OE.HOST AUDIT

### A.TRUSTED ADMIN

This assumption is directly covered by the objective on the environment OE.ADMIN

#### A.TRAINED ADMIN

This assumption is directly covered by the objective on the environment OE.ADMIN

### **A.CONFIGURATION**

This assumption is covered by OE.CARD\_ADMIN\_STATION which ensures that assets injected in TOE are consistent.

# 7.2 SECURITY REQUIREMENTS RATIONALE

### 7.2.1 **STUDY OF DEPENDENCIES**

The following table summarizes the dependencies of the security requirement components and justifies their satisfaction or non-satisfaction.

Component	Dependencies	Satisfaction
FIA_ATD.1	No dependencies.	
FIA_UAU.1	FIA_UID.1	Not fulfilled (justified)
FIA_UAU.5	No dependencies.	
FIA_UAU.4	No dependencies.	
FIA_SOS.1	No dependencies.	
FIA_SOS.2	No dependencies.	
FIA_AFL.1	FIA_UAU.1 <sup>3</sup>	FIA_UAU.1
FDP_ACC.2/access	FDP_ACF.1	FDP_ACF.1/access
FDP_ACF.1/access	FDP_ACC.1	FDP_ACC.2/access
	FMT_MSA.3	FMT_MSA.3/access
FMT_MSA.3/access	FMT_MSA.1	FMT_MSA.1/access
	FMT_SMR.1	FMT_SMR.1
FMT_MSA.1/access	FDP_ACC.1 or FDP_IFC.1	FDP_ACC.2/access
	FMT_SMR.1	FMT_SMR.1
	FMT_SMF.1	FMT_SMF.1
FCS_COP.1	FDP_ITC.1 or FDP_ITC.2 or FCS_CKM.1	FCS_CKM.1
		FDP_ITC.1/systemkey
	FCS_CKM.4	FCS_CKM.4
FCS_CKM.1	FCS_CKM.2 or FCS_COP.1	FCS_COP.1
	FCS_CKM.4	FCS_CKM.4
FCS_CKM.4	FDP_ITC.1 or FDP_ITC.2 or FCS_CKM.1	FDP_ITC.1/systemkey
		FCS_CKM.1
FDP_ACC.2/keys	FDP_ACF.1	FDP_ACF.1/keys
FDP_ACF.1/keys	FDP_ACC.1	FDP_ACC.2/keys
	FMT_MSA.3	Not fulfilled (justified)
FDP_ETC.1/keys	FDP_ACC.1 or FDP_IFC.1	FDP_ACC.2/keys
FDP_ITC.2/keys	FDP_ACC.1 or FDP_IFC.1	FDP_ACC.2/keys
	FTP_ITC.1 or FTP_TRP.1	FTP_TRP.1

 $<sup>^3</sup>$  This SFR satisfies the dependency requirement for each FIA\_AFL.1 instantiation (FIA\_AFL.1/userSC, FIA\_AFL.1/ephSC and FIA\_AFL.1/PUK)

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016			
Ver. : 5.1.2		Cryptosmart applet 5.1 - Public Security-			
<b>E</b> com	Public Security Target		<b>68/</b> 92		

	FPT_TDC.1	FPT_TDC.1
FMT_MSA.1/keys	FDP_ACC.1 or FDP_IFC.1	FDP_ACC.2/keys
	FMT_SMR.1	FMT_SMR.1
	FMT_SMF.1	FMT_SMF.1
FMT_MSA.2/keys	FDP_ACC.1 or FDP_IFC.1	FDP_ACC.2/keys
	FMT_MSA.1	FMT_MSA.1/keys
	FMT_SMR.1	FMT_SMR.1
FPT_TDC.1	No dependencies	
FDP_ITC.1/systemkey	FDP_ACC.1 or FDP_IFC.1	FDP_ACC.2/access
	FMT_MSA.3	Not fulfilled (justified)
FTP_TRP.1	No dependencies.	
FDP_RIP.1	No dependencies.	
FMT_SMR.1	FIA_UID.1.	FIA_UAU.1
FMT_SMF.1	No dependencies.	
FPT_EMSEC.1	No dependencies.	
FPT_FLS.1	No dependencies.	
FPT_PHP.1	No dependencies.	
FPT_PHP.3	No dependencies.	
FPT_TST.1	No dependencies.	

Table 6: SFR dependencies

### UNRESOLVED DEPENDENCIES JUSTIFICATION

**FIA\_UAU.1** ← **FIA\_UID.1**: the TOE is single user, user authentication provides identification. Therefore the FIA\_UID dependency does not need to be fulfilled

**FMT\_SMR.1** ← **FIA\_UID.1**: the TOE is single user, user authentication provides identification. Therefore the FIA\_UID dependency is replaced by **FIA\_UAU.1** 

**FDP\_ACF.1/keys** ← **FMT\_MSA.3:** access control to operation involving keys is based on key attributes. These attribute are not set statically but are set and managed by the user (**FDP\_ITC.2/keys** and **FMT\_MSA.1/keys**). Nevertheless only secure attribute may be set for keys with identifier 0 and 1 or when changing the initial attributes of a key (**FMT\_MSA.2/keys**).

**FDP\_ITC.1/systemkey** ← **FMT\_MSA.3**: the TOE does not define security attribute for wrapping keys. Their usage is fully controlled by SFP\_OPERATION\_ACCESS\_CONTROL which provides access control on the functions involving the wrapping key

Table 7: security requirements / objectives consistency matrix

#### 7.2.3 RATIONALE

# O.USER\_AUTHENTICATION is covered by:

- FIA\_ATD.1 which defines the authentication attributes for the local user (security code, ephemeral security code and validation flag and counter);
- FIA\_UAU.1 which defines the commands an unauthenticated user may perform;
- FIA UAU.5 which defines the different ways to authenticate an user :
  - Through its security code;
  - Through an ephemeral security code if the TOE is in a RESUMABLE state;
  - Through a PUK code if the TOE is in a BLOCKED state;
  - Implicitly by ability to use the host-card trusted path if the TOE is in a RESUMABLE state.
- FTP\_TRP.1 which defines a trusted path between the TOE and the local user. Successful usage of
  this trusted channel in RESUMABLE state implicitly authenticates the user by proof of knowledge of
  the protection keys.

### O.PUK\_UNBLOCK is covered by:

- FIA\_ATD.1 which defines the authentication attributes for the local user, in particular the TOE state;
- FIA\_UAU.5 which defines how to unblock the TOE: the user is authenticated by using PUK code, which turns the TOE from BLOCKED to VALIDATED USER state;
- FIA UAU.4 which ensures each PUK code may only be used once.

### O.STRONG\_SECCODE is covered by:

- FIA\_SOS.1 which ensures the user security code has the required length property;
- FIA\_SOS.2 which ensures that PUK codes and ephemeral code are correctly generated by the TOE
- FMT\_SMF.1 which allows the administrator toset a minimum security code length
- Correct management of security features (FMT SMR.1 and FMT SMF.1)

## O.LIMITED\_AUTH\_NUMBER is covered by:

• FIA\_AFL.1 which defines the maximum possible failures for each authentication method and the TOE behavior when this maximum tries has been reached.

### O.FUNCTION\_ACCESS\_CONTROL is covered by:

 The SFP\_OPERATION\_ACCESS\_CONTROL access control SFP (FDP\_ACC.2/access and FDP\_ACF.1/access) which ensure every command passed to the TOE follows the access control policy;

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016				
Ver. : 5.1.2	oryptoonian oura orr	Cryptosmart applet 5.1 - Public Security-				
<b>E</b> com	Public Security Target		71/92			

- FMT MSA.3/access which sets the default values for each command access right;
- FMT\_MSA.1/access which ensures no one can change access rights;
- Correct management of security features (FMT\_SMR.1 and FMT\_SMF.1)

### O.CRYPTOGRAPHIC\_OPERATION is covered by:

FCS\_COP.1 which defines the cryptographic algorithms the TOE shall support;

### O.STRONG MUTUAL AUTHENTICATION is covered by:

- FCS\_COP.1.1/random
- FCS COP.1.1/DH
- FCS\_COP.1.1/RSA\_sig
- FCS\_COP.1.1/SHA256
- FCS COP.1.1/HMAC
- FCS\_COP.1.1/AES
- FCS\_COP.1.1/EMAC

The mutual authentication is performed using the Cryptosmart authentication protocol. This protocol is based on the listed SFR.

### O.KEY MANAGEMENT is covered by:

- FCS\_CKM.1 which ensures user keys can be correctly generated by the TOE;
- FDP ITC.2/keyswhich ensures user keys may be imported to the TOE;
- FCS\_CKM.4 which ensure secure keys destruction of user keys;
- The SFP\_KEY\_ACCESS\_CONTROL ensures the security of key management, in particular:
  - FDP\_ACC.2/keys and FDP\_ACF.1/keys defines the access control to user keys;
  - o FMT\_MSA.1/keys and FMT\_MSA.2/keys focus on security attribute management by users
  - o FDP\_ETC.1/keys defining conditions under which keys may be exported from the TOE;
  - FDP\_ITC.2/keys defining conditions under which keys may be imported inside the TOE;
     FPT TDC.1 which ensures imported security attribute are correctly interpreted
- FF1\_1DC.1 willon ensures imported security attribute are correctly interpre
- Correct management of security features (FMT\_SMR.1 and FMT\_SMF.1)

## O.PROTECT\_SESSION\_KEY is covered by:

- FCS\_COP.1.1/AES and FCS\_COP.1.1/EMAC which ensure correct protection of session keys when stored outside the TOE;
- FDP\_ITC.1/systemkey supports FCS\_COP.1.1 by defining how wrapping which protect the session keys may be imported inside the TOE.
- FCS\_CKM1.1/random supports FCS\_COP.1.1 by defining how wrapping keys can generated by the TOE.

### O.APDU\_ENCRYPTION is covered by:

• FTP\_TRP.1 which ensure the usage of a trusted path, protected both in confidentiality and integrity, for sending command to the TOE and getting its responses.

#### O.SENSITIVE\_MEMORY\_ERASING and O.WIPEare both covered by:

- FDP\_RIP.1 which ensures non keys sensitive data are erased when no more needed;
- FCS\_CKM.4 which ensure the correct destruction of keys.

### O.EMSEC is covered by:

FPT EMSEC.1 which ensures that no side channel allow an attacker to access sensitive data

### O.TAMPER DETECTION is covered by:

- FPT\_TST.1 which ensures tamper attacks consequences can be detected
- FPT\_PHP.1 which ensures detection of physical tampering

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2		Cryptosmart applet 5.1 - Public Security-	
<b>E</b> com	Public Security Target		<b>72/</b> 92

# O.TAMPER\_RESISTANCE is covered by:

- FPT\_PHP.3 which ensures that an attacker may not access sensitive data by changing physical operational environment;
- FPT\_FLS.1 which ensures that the TOE remains in a secure state once an error which may be caused by tampering occurs

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016				
Ver. : 5.1.2	- 7,	Cryptosmart applet 5.1 - Public Security-				
<b>E</b> com	Public Security Target		<b>73/</b> 92			

#### 7.2.4 **SAR** RATIONAL

The aimed assurance level for this security target is EAL4 augmented with ALC\_DVS.2 and AVA\_VAN.5.

This level has been chosen to be as close as possible the French "qualification renforcée" package. (which also includes ADV\_IMP.2 and ALC\_FLR.3 which can't be claimed as these component are not met by the platform).

The ALC\_DVS.2 component has no dependencies.

The AVA\_VAN.5 component has for dependencies:

- ADV\_ARC.1 Security architecture description
- ADV FSP.4 Complete functional specification
- ADV\_TDS.3 Basic modular design
- ADV\_IMP.1 Implementation representation of the TSF
- AGD\_OPE.1 Operational user guidance
- AGD\_PRE.1 Preparative procedures
- ATE\_DPT.1 Testing: basic design

Which are all included in the EAL4 package. Therefore every requirement for the chosen SAR is fulfilled.

Table 8: Mapping toe sfrs to toe security functions

Ed : 2010B/346	Cryptosmart card 5.1	November 7, 2016				
Ver. : 5.1.2		Cryptosmart applet 5.1 - Pul	olic Security-			
<b>E</b> com	Public Security Target		77/92			

#### 7.3.2 RATIONALE

This section describes how the TOE security functions described in TOE summary specification meet each SFR.

**FIA\_ATD.1 (User attribute definition)** describes the list of attributes belonging to users. This component is met by SF.IA\_AUTH\_PARAMETER which defines the user related elements maintained by the TOE.

**FIA\_UAU.1 (Timing of authentication)** describes the functions the TOE may perform without having the user authenticated. This component is met by SF.PR\_ACCESS\_RIGHTS which defines these actions.

**FIA\_UAU.5 (Multiple authentication mechanisms)** describes the different available authentication types. This component is met by SF.IA\_SECURITY\_CODE SF.IA\_PUK\_CODESF.IA\_EPHEMERAL\_SECURITY\_CODESF.IA\_LIGHT\_AUTH which each defines an individual authentication type supported by the TOE.

**FIA\_SOS.1 (Verification of secrets)** requires a mechanism to verify secrets length. This component is met by SF.IA\_SECURITY\_CODE which defines the required secret length.

**FIA\_SOS.2** (Generation of secrets) describes the methods the TOE shall use to generate secrets and the authentication method which require generated secrets usage. This component is met by SF.IA\_PUK\_CODE and SF.IA\_EPHEMERAL\_SECURITY\_CODE which specify that they must use TOE generated secrets and SF.CR\_RNG which defines the generation method of secrets.

**FIA\_AFL.1 (Authentication failure handling)** describes how the TOE shall react on authentication failure. The authentication mechanism descriptions SF.IA\_SECURITY\_CODE SF.IA\_PUK\_CODE SF.IA\_EPHEMERAL\_SECURITY\_CODE each describe how to handle authentication failure.

The FDP\_ACC.2/access (Complete access control) and FDP\_ACF.2/access (Security attributes based access control) components are met by SF.PR\_ACCESS RIGHTS which defines the access control method to sensitive assets.

**FMT\_MSA.3/access (Static attributes initialization)** defines how attributes used for FDP\_ACF.2/access are initialized. SF.PR\_ACCESS RIGHTS defines this initialization.

**FMT\_MSA.1/access (Management of security attributes)** requires that attributes used for FDP\_ACF.2/access may not be changed. SF.PR\_ACCESS RIGHTS meets this requirement by explicitly stating this.

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016				
Ver. : 5.1.2		Cryptosmart applet 5.1 - Public Security-				
<b>E</b> com	Public Security Target		<b>78/</b> 92			

**FCS\_COP.1 (Cryptographic operation)** defines how the TOE shall perform cryptographic operation. This component is instantiated for:

- Diffie-Hellman operation
- AES operation
- SHA256 message digest operation
- HMAC MAC operation
- EMAC MAC operation
- RSA signature
- RSA encryption
- Random generation

These requirements are met respectively by:

- SF.CR\_STATEFULL\_AUTHENTICATION and SF.CR\_STATELESS\_AUTHENTICATION
- SF.CR AES and SF.CR KEY DERIVATION
- SF.CR\_STATEFULL\_AUTHENTICATION and SF.CR\_STATELESS\_AUTHENTICATION and SF.CR LOCAL PROTECTION KEY
- SF.CR\_MAC, SF.CR\_STATEFULL\_AUTHENTICATION andSF.CR STATELESS AUTHENTICATION
- SF.CR\_MAC and SF.CR\_KEY\_DERIVATION
- SF.CR RSA SIGN
- SF.CR\_RSA\_ENCRYPT
- SF.CR\_RNG

Which each define the cryptographic functions of the TOE.

**FCS\_CKM.1 (Cryptographic key generation)** defines how the TOE shall generate RSA and symmetric keys. This is directly met by SF.CR\_KEY\_GENERATION.

FCS\_CKM.4 (Cryptographic key destruction): This component is met by SF.CR\_KEY\_DESTRUCTION which describes key destruction.

The **FDP\_ACC.2/keys (Complete access control)** component is met by SF.PR\_KEY\_ACCESS\_CONTROL which defines the access control method to user keys.

The FDP\_ACF.2/keys (Security attributes based access control) component is met by SF.PR\_KEY\_ACCESS\_CONTROL which defines the access control method to user keys.

The FDP\_ETC.1/keys (Export of user data without security attributes) component is met by SF.GS\_admin and SF.GS userwhich defines the management operation on user keys.

The FDP\_ITC.2/keys (Import of user data with security attributes) component is met by SF.GS\_admin and SF.GS\_user which defines the management operation on user keys.

The FPT\_TDC.1 (Inter-TSF basic TSF data consistency) component is met by SF.GS\_admin and SF.GS\_user which defines the management operation on user keys.

**FMT\_MSA.1/keys** (Management of security attributes) defines how and by whom attributes used for FDP\_ACF.2/keys may be changed. SF.GS\_ADMIN and SF.GS\_USER meet this requirement by defining management possibilities respectively for the administrator and the user.

**FMT\_MSA.2/keys (Secure security attributes)** defines the attribute management limitations. This requirement is met by SF.GS\_ADMIN and SF.GS\_USER which state these limitations.

**FDP\_ITC.1/systemkey (Import of user data without security attributes)** is met by SF.GS\_ADMIN which specifies how administrator keys are imported.

**FTP\_TRP.1 (Trusted path)** requires usage of a protected channel (in confidentiality, integrity and against replay) for passing commands to the TOE. It also defines the commands for which this channel is not necessary. This is met by SF.PR\_APDU which defines such a trusted channel.

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016				
Ver. : 5.1.2		Cryptosmart applet 5.1 - Public Security-				
<b>E</b> com	Public Security Target		<b>79/</b> 92			

- **FDP\_RIP.1 (Residual Information Protection):** This component is met by SF.PR\_RESIDUAL\_WIPE which describes destruction of sensitive elements (which are not cryptographic keys).
- **FMT\_SMR.1 (Security roles)** describes the roles of TOE users. This component is met by SF.IA\_ROLES which defines these roles.
- **FMT\_SMF.1 (Specification of Management Functions):** This component is met by SF.GS\_ADMIN and SF.GS\_USER which describe the management functions the administrator or the user may perform.
- **FPT\_EMSEC.1:** this component is met by SF.PTF\_PHYS which ensures that there is no information leakage allowing retrieving sensitive data.
- **FPT\_FLS.1** (Failure with preservation of secure state):this component is met by SF.PTF\_SAFESTATE\_MGT which ensures that in case of major error an attacker may not have access to sensitive data (destruction of the TOE).
- FPT\_TST.1 (TSF testing):this component is met by SF.PTF\_SAFESTATE\_MGT which monitors the integrity of the TOE and the TSF data by performing selftests.
- **FPT\_PHP.1 (Passive detection of physical attack):** this component is met by SF.PTF\_PHYS which ensures detection of physical tampering or detection of errors which are consequences of a physical tampering
- **FPT\_PHP.3 (Resistance to physical attack):** this component is met by SF.PTF\_PHYS which ensures that the TOE takes countermeasures against physical manipulation.

# 8. Consistency of composite product security target

# 8.1 SEPARATION OF TSF

The composite product is an applet loaded on the platform. The platform offers protection to the applet and its sensitive data against all relevant threat from [IOC7 - ST].

# 8.2 COMPATIBILITY OF SAR

The following table summarizes the SAR for both the composite product and the platform, showing that every platform SAR is greaterthan or equal tocomposite SAR.

Assurance class	Assurance component	Platform Level	Composite Level
	ADV_ARC	1	1
	ADV_FSP	5	4
Development	ADV_IMP	1	1
	ADV_INT	2	N.A.
	ADV_TDS	4	3

# 8.3 COMPATIBILITY OF SFR

As TSF, every platform SFR is relevant to the composite security target.

Nevertheless some application SFRs are based on platform SFR. This section aims at identifying these dependencies and verifying that operations performed by composite SFR on platform SFR are appropriate.

Composite SFR	Based on (platform SFR)	Statement of compatibility
	Fully (F) or Partially (P)	
FIA_ATD.1	None	User attributes are only related to the Cryptosmart applet
FIA_UAU.1	None	Timing of authentication is only related to the Cryptosmart applet
FIA_UAU.5	FIA_AFL.1/Pin (P) FMT_MTD.1/Pin (P)	Authentication codes (security code, ephemeral code and PUK codes) are stored as OwnerPIN objects.
FIA_UAU.4	FIA_AFL.1/Pin (P) FMT_MTD.1/Pin (P)	The Cryptosmart applet stores PUK code as OwnerPin objects with maximum authentication attempts defined to 1.
FIA_SOS.1	None	
FIA_SOS.2	None.	These secrets are generated by the TOE using the applet's internal random generator.
FIA_AFL.1	FIA_AFL.1/Pin (F)	The applet bases security code and PUK code management on OwnerPin objects. The maximum unsuccessfull authentication failure is considered reached if the OwnerPin object is blocked.
FDP_ACC.2/access	None.	The SFP_OPERATION_ACCESS_CONTROL policy is entirely managed by the Cryptosmart applet.
FDP_ACF.1/access	None.	
FMT_MSA.3/access	None.	
FMT_MSA.1/access	None.	
FCS_COP.1.1/AES	FCS_COP.1/AES (P)	The applet only uses 128 and 256 bits AES keys which are consistent with the platform SFR.
FCS_COP.1/SHA256	FCS_COP.1/SHA (F)	The applet directly uses the applet's sha256 implementation using javacard API
FCS_COP.1.1/HMAC	FCS_COP.1/SHA (P) FCS_COP.1/AES (P)	The applet performs HMAC-SHA256 based on the SHA256 defined by this SFR. HMAC mode is implemented by the applet.  The applet uses AES signature verification
		for implementing signature verification as array comparison

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2		Cryptosmart applet 5.1 - Pu	blic Security-
<b>E</b> com	Public Security Target		<b>82/</b> 92

Composite SFR	Based on (platform SFR)	Statement of compatibility
	Fully (F) or Partially (P)	
FCS_COP.1.1/EMAC	FCS_COP.1/AES (P)	The applet performs EMAC (retail cbc-mac) based on AES with 128 bits keys which is consistent with the platform SFR.
FCS_COP.1.1/RSA_sig	FCS_COP.1/RSA (P)	The applet only uses 2048 bits RSA keys (in CRT form) for signature operation, which is consistent with the platform SFR.
FCS_COP.1.1/RSA_enc	FCS_COP.1/RSA (P)	The applet only uses 2048 bits RSA keys (in CRT form) for decryption operation, which is consistent with the platform SFR.
FCS_COP.1.1/random	FCS_RNG.1/IC_SOFT (P)	The applet generates random number by:
	FCS_COP.1/AES (P)	<ul> <li>Generating a random buffer using the SecureRandom javacard object</li> <li>Postprocessing it using an AES based DRBG</li> </ul>
FCS_COP.1.1/DH	FCS_COP.1/RSA (P)	The applet only uses 2048 bits modulus which is consistent with the platform SFR.
		Diffie-Hellman computations rely on FCS_COP.1/RSA in SFM mode.
FCS_CKM.1.1/RSA	FCS CKM.1.1 / RSA (F)	
FCS_CKM.1.1/random	None.	These keys (symmetric keys and DH private keys) are generated at random using the applet generator.
FCS_CKM.1.1/local_prot	FCS_COP.1/SHA (P)	The applet performs the key generation based on the SHA256 defined by this SFR.
	FCS_CKM.4 (F) for keys values stored in a key object in NVM	Keys stored as javacard objects are cleared using the clearKey() method.
FCS_CKM.4	FDP_RIP.1.1/KEYS (F) for keys values stored in the cryptographic buffer.	Cryptographic keys which are stored as arrays are erased by zeroization
	FDP_RIP.1.1/APDU (F) and	
	FDP_RIP.1.1/TRANSIENT (F) for key values stored in volatile memory	
FDP_ACC.2/keys	None.	
FDP_ACF.1/keys	None.	
FDP_ETC.1/keys	None.	
FDP_ITC.2/keys	FCS_CKM.2 (P)	User keys are imported then stored in javacard objects using the setKey() method.
FPT_TDC.1	None.	
FMT_MSA.1/keys	None.	

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2		Cryptosmart applet 5.1 - Pul	olic Security-
<b>E</b> com	Public Security Target		83/92

Composite SFR	Based on (platform SFR)	Statement of compatibility
	Fully (F) or Partially (P)	
FMT_MSA.2/keys	None.	
FDP_ITC.1.1/systemkey	None.	
FTP_TRP.1	None.	Trusted path protection is based on composite SFRs FCS_COP.1.1/AES, FCS_COP.1.1/EMAC for confidentiality and integrity protection and FCS_COP.1.1/RSA_enc for key establishment.
EDD DID (	FCS_CKM.4 (F) and FDP_RIP.1.1/KEYS (F) for keys values stored in the cryptographic buffer.	Session keys are stored as javacard key objects and benefit from the FCS_CKM.4 and FDP_RIP.1.1/KEYS SFR.  Keys may transit through temporary
FDP_RIP.1	FDP_RIP.1.1/APDU (F) and	location and are then erased either through
	FDP_RIP.1.1/TRANSIENT (F) for key values stored in volatile memory	FDP_RIP.1.1/APDU or FDP_RIP.1.1/TRANSIENT.
FMT_SMR.1	None	
FMT_SMF.1	None	
FPT_FLS.1	Fully supported by the platform SFRs:  FAU_ARP (F)  • FAU_ARP.1/JCS; • FAU_ARP.1.1/IC;  FPR_RCV (F)  • FPT_RCV.3/SCP; • FPT_RCV.4/SCP;  FPT_FLS (F)  • FPT_FLS.1/JCS; • FPT_FLS.1/JCS; • FPT_FLS.1/SCP;  FRU_RSA (F)  • FRU_RSA.1.1/Installer;  FDP_ROL (F)  • FDP_ROL.1/FIREWALL;  FRU_FLT (F)  • FRU_FLT.1/SCP;  FDP_RIP.1/APDU; • FDP_RIP.1.1/KEYS; • FDP_RIP.1.1/TRANSIENT; • FDP_RIP.1/IC;	This SFR is implemented on platform side only and is independent from the Cryptosmart applet.

<b>E</b> com	Public Security Target		84/92

Composite SFR	Based on (platform SFR)	Statement of compatibility
	Fully (F) or Partially (P)	
FPT_PHP.1	Fully supported by the platform SFR FPT_PHP.3/SCP (F)	This SFR is implemented on platform side only and is independent from the Cryptosmart applet.
FPT_PHP.3	Fully supported by the platform SFRsFPT_PHP.3/SCP (F)	This SFR is implemented on platform side only and is independent from the Cryptosmart applet.
FPT_TST.1	Fully supported by the platform SFRs:  FPT_TST.1/RESET (F)  FPT_TST.1/FIRST_USED (F)  FDP_SDI.2 (F)	This SFR is implemented on platform side only and is independent from the Cryptosmart applet.
FPT_EMSEC.1	Fully supported by the platform SFRs:  FPR_UNO.1(F)  FPR_UNO.1/USE_KEY(F)  FPR_UNO.1/applet (F)  FPR_UNO.1/IC (F)	This SFR is implemented on platform side only and is independent from the Cryptosmart applet.

Table 10: SFR compatibility

#### 8.4 COMPATIBILITY OF SECURITY OBJECTIVES

Only a subset of the platform security objectives (as described in [IOC7-ST])is relevant to the composite security target.

The security objectives of the composite security target can be divided into security objectives corresponding to:

- Security objectives provided by the underlying javacard platform;
- Security objectives provided by the composite TOE, fulfilled by the combination of the applet and the underlying javacard platform

The table below lists the security objectives provided by the composite TOE and for each of them gives the security objectives from the platform it relies on.

Security objectives of the composite TOE	Rely on the following objectives from the underlying platform, either Fully (F) or Partly (P)
O.USER_AUTHENTICATION	O.PIN-MNGT (user security code and PUK are managed as platform Pin objects)  (F)
O.PUK_UNBLOCK	O.PIN-MNGT (PUK codes are managed as platform Pin objects) (F)
O.STRONG_SECCODE	None.

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2		Cryptosmart applet 5.1 - Pul	blic Security-
<b>E</b> com	Public Security Target		<b>85/</b> 92

Security objectives of the composite TOE	Rely on the following objectives from the underlying platform, either Fully (F) or Partly (P)
O.LIMITED_AUTH_NUMBER	O.PIN-MNGT (user security code and PUK are managed as platform Pin objects which manage the failure limit)
	(P)
O.FUNCTION_ACCESS_CONTROL	None.
O.CRYPTOGRAPHIC_OPERATION	O.CIPHER,: cryptographic operation done by the applet use platform provided cryptographic functions.
	(P)
O.STRONG_MUTUAL_AUTHENTICATION	O.CIPHER: cryptographic operation done by the applet use platform provided cryptographic functions.
	(P)
O.KEY_MANAGEMENT	O.KEY-MNGT: user keys are managed as platform key object
O.K. I _IVIANAGLIVILINI	(P)
	O.CIPHER: key wrapping is performed using platform provided cryptographic functions
O.PROTECT_SESSION_KEY	O.KEY-MNGT
	(P)
O.APDU_ENCRYPTION	O.CIPHER: APDU encryption is performed using platform provided cryptographic functions
	(P)
	O.KEY-MNGT: for user keys as the platform provides a method to clear keys.
O.SENSITIVE_MEMORY_ERASING	O.REALLOCATION
	(P)
O.WIPE	O.KEY-MNGT: for user keys as the platform provides a method to clear keys.
	(P)
	O.SECURE_COMPARE
O.EMSEC	O.CIPHER
o.Linozo	O.PIN-MNGT
	(F)
	O.RESOURCES
O.TAMPER_DETECTION	O.ALARM
	(F)
	O.OPERATE
	O.TRANSACTION
O.TAMPER_RESISTANCE	O.SCP.RECOVERY
_	O.SCP.SUPPORT
	O.SCP.IC
	(F)

Table 11: Compatibility of security objectives

The table below lists, (1) the security objective fulfilled by the underlying javacard platform, (2) and for each of them:

The list of all the corresponding SFRs according to [IOC7 - ST]

Table 12: Mapping of platform's security objectives to platform's SFR

#### 8.5 COMPATIBILITY OF SECURITY OBJECTIVES FOR THE ENVIRONMENT

The significant security objectives for the environment of the platform security target are not contradictory to those of the composite security target.

Platform security objectives for the environment concern applet content and loading on the smartcard. The objectives for the environment of the composite TOE include those of the platform, and objectives concerning:

- The Cryptosmart applet development, generation and storage
- The environment for pre-personalization;
- The environment for personalization;
- The host behavior;
- Usage constraints.

Therefore these objectives are independent and do not contradict themselves.

### **8.6 COMPATIBILITY OF THREATS**

All the platform threats are relevant to the composite security target.

The threats of the composite security target can be divided into threats corresponding to:

- The platform specific threats;
- Refinements of platform threat to applet specific assets (T.PHYSICAL);
- Applet specific threats.

The threats of the composite security target are not contradictory to the relevant threats of the platform security target.

### 8.7 COMPATIBILITY OF OSP

The platform has only one OSP (OSP.VERIFICATION) concerning bytecode verification before execution on the platform.

The OSPs from this ST only apply on the composite TOE once the Cryptosmart applet is loaded; and concern:

Ed: 2010B/346	Cryptosmart card 5.1	November 7, 2016	
Ver. : 5.1.2		Cryptosmart applet 5.1 - Pul	blic Security-
<b>E</b> com	Public Security Target		91/92

- Directives the composite TOE must follow;
- Service the composite TOE must offer;
- Security rules the composite TOE must implement.

The OSP of the composite security target are independent and not contradictory to the relevant OSPs of the platform security target.

#### 8.8 COMPATIBILITY OF ASSUMPTIONS

The platform assumptions only concern applet content and loading on the smartcard. Assumptions for the composite TOE concern correct TOE administration security (reliability of the administrator, generation and management of cryptographic keys).

Those two types of assumptions are independent and are not contradictory.

#### 8.9 COMPATIBILITY WITH [ANSSI-NOTE-10]

After the delivery point the objectives OE1 and OE2 are not relevant for the TOE as the TOE is in closed configuration (the Card Manager is deactivated): no more applet can be loaded and the applet cannot be deleted.

The platform security target [IOC7-ST] defines the security objectives for its environment OE.VERIFICATION and OE.APPLET for fulfilling OE1 and OE2 from [ANSSI-NOTE-10]. As a matter of fact, OE1 and OE2 only apply to the development phase of the TOE, before the point of delivery.

OE1 is fulfilled as (1) the Cryptosmart applet is designed not to contain any native code, and (2) its bytecode is verified before the applet being loaded onto the platform.

The security objectiveOE2 from [ANSSI-NOTE-10] is also fulfilled by organizational measure as the ALC\_DVS.2assurance class ensures the integrity of the applet loaded onto the platform.
